NONDISCRIMINATION STATEMENT

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, SW., Washington, DC 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

PRIVACY ACT STATEMENT

The above statements are made in accordance with the Privacy Act of 1974 (5 U.S.C. Section 522a).

Statement of Work

Purpose

The purpose of this agreement, between the U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS) and Cheyenne and Arapaho Tribes (Recipient), is to build markets for climate-smart commodities and invest in America's climate-smart producers to strengthen U.S. rural and agricultural communities.

Objectives

The objectives of this project are to support the production and marketing of climate-smart commodities by providing voluntary incentives to producers and landowners, including early adopters, to implement climate-smart agricultural production practices, activities, and systems on working lands; measure/quantify, monitor and verify the carbon and greenhouse gas (GHG) benefits associated with those practices; and develop markets and promote the resulting climate-smart commodities.

Budget Narrative

The official budget summarized below and described in the attached Budget Narrative will be considered the total budget as last approved by the Federal awarding agency for this award.

Amounts included in this budget narrative are estimates. Reimbursement or advance liquidations will be based on actual expenditures, not to exceed the amount obligated.

TOTAL BUDGET \$6,999,356

TOTAL FEDERAL FUNDS \$6,999,356 PERSONNEL \$1,046,808 FRINGE BENEFITS \$282,638 TRAVEL \$20,660 EQUIPMENT \$0 SUPPLIES \$1,445,000 CONTRACTUAL \$14,400 CONSTRUCTION \$0 OTHER \$3,596,201 (includes PRODUCER INCENTIVES \$0) TOTAL DIRECT COSTS \$6,405,707 INDIRECT COSTS \$593,649

TOTAL NON-FEDERAL FUNDS \$0 PERSONNEL \$0 FRINGE BENEFITS \$0 TRAVEL \$0 EQUIPMENT \$0 SUPPLIES \$0 CONTRACTUAL \$0 CONSTRUCTION \$0 OTHER \$0 (includes PRODUCER INCENTIVES \$0) TOTAL DIRECT COSTS \$0 INDIRECT COSTS \$0

Recipient has an approved Negotiated Indirect Cost Rate Agreement (NICRA) with a rate of 21.13% and a base of Total direct costs, less capital expenditures and passthrough funds. Passthrough funds are normally defined as payments to participants, stipends to eligible recipients, or subawards, all of which normally require minimal administrative effort.

Ensure that equipment purchased with Federal funds is used until no longer needed as described in the General Terms and Conditions and 2 CFR 200. If the residual value of the equipment is \$5,000 or more at the time it is no longer needed, the recipient must request disposition instructions. The disposition instructions may direct the recipient to: 1) sell the equipment and return a proportionate share of the proceeds to the Federal agency; 2) transfer title to another eligible entity identified by the Federal agency; or 3) keep the equipment if desired and compensate the Federal agency for its proportionate share of the value.

Responsibilities of the Parties:

If inconsistencies arise between the language in this Statement of Work (SOW) and the General Terms and Conditions attached to the agreement, the language in this SOW takes precedence.

RECIPIENT RESPONSIBILITIES

Perform the work and produce the deliverables as outlined in this Statement of Work and attachments.

Ensure Paperwork Reduction Act (PRA) clearance is obtained prior to conducting data collection from producers or other project participants, including data collection performed by subrecipients.

Comply with the applicable version of the General Terms and Conditions.

Submit reports and payment requests to the ezFedGrants system as outlined in the applicable version of the General Terms and Conditions. Reporting frequency is as follows:

Performance Reports: Quarterly

SF425 Financial Reports: Quarterly

Detailed Progress Report: Quarterly (The detailed progress report is in addition to the performance and financial reports referenced above and described in the general terms and conditions)

Expected Accomplishments and Deliverables

See attached Benchmarks Table and associated Project Narrative.

Resources Required

See the Responsibilities of the Parties section for required resources, if applicable.

Milestones

See attached Benchmarks Table and associated Project Narrative.

GENERAL TERMS AND CONDITIONS

Demonstration, Expansion, and Quantification of the Benefits of a Climate Smart Commodity: Verified Regenerative Bison Products

I. Executive Summary

In this project, we will:

1. Develop a demonstration program on tribal lands, implementing and expanding multiple climate-smart practices in the production of American bison. This program will showcase the benefits of regenerative bison production to rangeland, ranchers, and climate. It will increase climate resilience of ranching operations, reduce net greenhouse gas (ghg) emissions, and direct the financial benefits of climate-smart commodity production to ranchers, including tribal groups and early adopters.

2. Leverage this demonstration program, as well as the recent history of tribal bison reintroduction programs around the country, to rigorously quantify the climate impacts of regenerative bison production in comparison with the baseline of conventional beef production. In this quantification, we will also trial streamlined processes—based on remote sensing and automation of soil-carbon measurement—to reduce monitoring costs for future adopters.

3. Create a new entity to maintain standards of regenerative bison production, track climate benefits and payment for those benefits through the supply chain, establish consumer trust in and appreciation for the multiple benefits of Verified Regenerative Bison Products, and thus foster a market-driven expansion of the practices demonstrated and studied in this program.

The lead on this proposal is the Cheyenne and Arapaho Tribes Agricultural Program, represented by Lorna Carter (100 Red Moon Circle, Concho, Oklahoma 73022, 405-422-7711, lcarter@chevenneandarapaho-nsn.gov). Project partners include Frasier Bison LLC (h ttps://frasierbison.com/), a consulting bison specialist; Collaborative Earth (formerly known as Earthshot Institute) (https://www.collaborative.earth/), a non-profit scientific research organization specializing in the use of advanced technologies to measure and model environmental impacts; Mad Agriculture (https://madagriculture.org/), a non-profit organization specializing in outreach to producers and development of markets to support transitions to sustainable practices; and several Tribal Buffalo programs around the country, with whom we interface through the Eastern Shoshone Tribal Buffalo Program (https://easternshoshone.org/) and the Intertribal Buffalo Council (ITBC) (h ttps://itbcbuffalonation.org/).

Project management will be divided among partners according to their areas of focus and expertise. For design and implementation of the demonstration program, Frasier Bison and the Cheyenne and Arapaho Agricultural Program possess the requisite expertise. For MMRV, Collaborative Earth will coordinate research overseen by our contracted partners Dr. Stephen Porder (Brown University) and Dr. Paul Stoy (University of Wisconsin) and executed by Collaborative Earth's Postdoctoral Fellows and Bison Lab. For outreach to ranchers, the Cheyenne and Arapaho Agricultural Program and Mad Ag will work through their networks of hundreds of cattle and bison ranchers. The regenerative bison verification program will be developed through a collaboration between the partners in this proposal and the Savory Institute's Land to Market Program, allowing us to build out a new set of verification processes and criteria within the Savory Institute's established program. For access to markets offering a premium for climate-smart commodities, we will access Mad Ag's extensive network of distributors and retailers emphasizing sustainability-oriented products.

While there is evidence in the scientific literature for the climate-related benefits of regenerative bison production, the industry is nascent. Consequently, better data informing USDA Comet for grazing practices with American bison are needed; ranchers cannot yet benefit from a significant price premium tied to the carbon-sequestration potential of regenerative grazing with bison; and ranchers do not yet have the practical guidance or financial incentives needed to transition to this culturally and ecologically important species. This project will address all three of these important unmet needs.

This project minimizes costs associated with activities in several ways. First, rather than building whole new systems for tracing the benefits of our climate-smart commodity, we will build on well-established practices for verification and tracking chain of custody, expanding and adapting them to apply to regenerative bison and to incorporate data on ghg emissions and other ecosystem services. Second, in the course of this project, we will move from the most thorough 'gold-standard' of measuring ecological impacts, including ghg emissions, to more efficient and scalable methods based on remote sensing, machine learning, and automation. Third, we will leverage the open-science ecosystem supported by Collaborative Earth, greatly reducing overhead and expense associated with research in traditional University contexts.

Fittingly, our demonstration program will be located on the site of three schools that were established in the 19th century to teach Cheyenne and Arapaho children. In the project described here, the Cheyenne and Arapaho, along with the Eastern Shoshone and other tribal members of the ITBC, will furnish an educational and compelling case of tribal development of ranching practices to restore thriving grassland ecosystems, enhance their resilience, and mitigate climate change. These practices are centered around American bison, a species of ancient spiritual importance to the plains tribes of North America. This project thus represents a new kind of school, offering a synthesis of deep traditions with advanced technologies to

develop and demonstrate the benefits of a climate-smart commodity, Verified Regenerative Bison Products.

II. Development of a demonstration program on tribal lands, implementing and expanding multiple climate-smart practices in the production of American bison

i. Context and Outreach

The Cheyenne and Arapaho Reservation, established in 1869, covered 4,300,000 acres in what is now western Oklahoma. These lands are in the transition zones ranging from tallgrass prairie to shortgrass high-plains prairie. Rolling hills and broad plains are dissected by river valleys, where moist riparian ecosystems harbor cottonwoods. In small pockets where hardwood stands have not been removed, postoak-blackjack and shinnery oak forests thrive. These prairie ecosystems represent one of the planet's most stable available repositories of carbon (1); they are capable of sequestering between 3 and 9 megagrams of carbon per hectare per year (2-4). Tragically, tilling and overgrazing have squandered much of this carbon-storage capacity (3). In the project proposed here, we will demonstrate how this vital ecosystem service can be recovered through active restoration efforts and regenerative grazing with the dominant native herbivore, American bison.

During the Reservation Era, farming and industrial skills were taught to Cheyenne and Arapaho children at four different schools established on the reservation. In this Partnership for Climate Smart Commodities (PCSC) project, an educational and compelling demonstration of holistic regenerative rangeland management, centered on Verified Regenerative Bison, will be implemented at the location of three of these former schools. We are writing a new chapter in the history of these schools, making their former grounds a place where the Cheyenne and Arapaho Agricultural Program will document and showcase climate-smart practices that regenerate the prairie through management of our ecologically and culturally vital native grazer.

Today, the Cheyenne and Arapaho Agriculture Program manages approximately 8,400 acres utilizing regenerative and conservation agriculture practices. The Tribes began their climatesmart planning activities in 2015, when they launched their grassland restoration project. Rangeland Health Assessments were conducted in 2015 on 2,084 acres to establish baseline data from which improvement efforts can be measured. These rangeland acres were inventoried to determine plant composition and estimated forage productivity. The data revealed that some areas of Tribal rangeland contains 97% of the plant species from original prairies, while in other areas, biodiversity had been reduced to as little as 10% of the original species present. This assessment provided the baseline data from which restoration plans were developed. The Cheyenne and Arapaho tribes began to implement climate-smart production practices in 2016 and have since purchased over \$220,000 in low-till and no-till equipment. As an advocate for soil health principles, the Tribes entered into a landmark soil health agreement in January 2017 with the United States Department of Agriculture Natural Resource Conservation Service to establish a demonstration farm showcasing advanced soil-health techniques. The agreement was the first of its kind between the NRCS and an Indian tribe. Conservation technologies used to improve lands managed by the Cheyenne and Arapaho were demonstrated on a 70-acre area in partnership with the USDA NRCS. The Tribes were cohosts of four soil health workshops throughout western Oklahoma in 2017.

Grassland restoration on Cheyenne and Arapaho Tribal lands began in 2018. Smaller isolated fields previously farmed for row crops were converted to native grasslands, utilizing both native grass seed mixtures and monoculture plantings. The restoration efforts also started over-seeding existing pastures with native grasses and legume inter-seeding. Mechanical treatments were started for the removal of invasive tree species in the livestock pastures. A prescribed burn program was established as a means to reduce hazardous fuel accumulations, to aid in restoring the prairie ecosystems and landscapes, and to assist in controlling woody invasive species in the grasslands. Over 3,000 acres have been placed in the prescribed burn rotation.

Expanding on the success of facilitating soil health workshops, the agriculture program began participating in additional educational events. These include co-hosting bison management workshops with the USDA NRCS and other private ranches. The largest event co-hosted by the Cheyenne and Arapaho Agriculture Program has been the National Land and Range Judging Contest. Nearly 1,000 4-H and FFA students from over 30 states have gathered on the Tribal lands for the event. The Tribes have co-hosted three of these national events in the past seven years.

Thus, prior to the pandemic shutdown of in-person gatherings, the Cheyenne and Arapaho agriculture program was active with outreach efforts to share their experiences of grasslands restoration and regenerative bison management. In the PCSC project proposed here, the agriculture program will build on its successful history of education and outreach efforts to introduce many more producers to the environmental and financial benefits of regenerative grasslands management centered on Verified Regenerative Bison Products. Working in concert with the regenerative, scientific, and market-development activities described below, one full-time outreach professional will offer ranch visits, short courses for practitioners, and speaking engagements at conferences and events. We project that we can introduce and teach these practices to at least 100 producers during years three and four of this project, resulting in implementation in at least 25 operations comprising at least 125,000 acres.

Anticipating producer interest in the methods showcased in our demonstration project, as well as in the opportunities for premium prices commanded by Verified Regenerative Bison Products, Mad Ag will explore a new application of its financing mechanism that has already demonstrated success in transitioning conventional broad acre farmers into organic and regenerative cultivation methods. In essence, financing is provided by impact capital funds offering reasonably priced loans that enable a producer to cross a valley of cost in order to achieve higher returns from certified production techniques. In the present case, the transition will be from conventional cattle production to verified regenerative bison production.

ii. The New Regenerative Demonstration Program.

The headquarters for the Cheyenne and Arapaho Tribal government is at the Concho Reserve, which is also where the first school was established. The Darlington School, Indian Territory, opened in 1871. Passing through the Concho Reserve was the Chisholm Trail, a famed cattle route, drawn to the area by an abundant supply of water from Caddo Springs. These springs are still flowing today. Of the 3,500 acres of Concho Reserve that will be included in this PCSC demonstration project, 1,100 acres, centered around the Caddo Springs, will be managed as a riparian area. Net carbon sequestered annually as a result of regeneration of the riparian zone will be measured as part of our MMRV program, described below, and the ghg benefits will be linked explicitly to the Verified Regenerative Bison Products, as part of the whole-operation ghg accounting. Thus, this area of the larger demonstration project will be used to document and measure the considerable benefits in ghg sequestration that can be achieved through effective riparian regeneration of a form compatible with raising Verified Regenerative Bison. In general, riparian zone restoration can be an important component of the overall ghg reduction program implemented in holistically managed ranches. This component of our demonstration program therefore has scalable impact for adoption by other producers throughout U.S. grasslands.

Riparian Restoration efforts will focus on a total of 1,680 acres of Cheyenne and Arapaho lands. The removal of invasive trees and shrubs from the bison pastures will be rebalanced with the planting of native trees in the moist riparian areas. Simple interventions, including installation of beaver dam analogs and riverbank plantings, can have significant effects on riparian productivity and drought resilience, as has been well-documented in the literature (*5-7*).

In connection with our riparian restoration efforts, we note that climate-smart agriculture requires not only sequestering more carbon, but also building greater climate-change resilience into agricultural systems. Riparian environments exhibit significant microclimatic differences from open grasslands; they can be critical refuges in periods of extreme heat. In addition, their water-storing capacities increase drought resilience. Our native grazer, bison, also appear to be better at managing climatic extremities than cattle, which are a northern

European species. In this regard, bison appear to be a pre-adapted 'climate-smart' grazing species (8).

The Canton Reserve of the Cheyenne and Arapaho Reservation is where the Cantonment military post was established. When the military post was abandoned, in 1882, the Cantonment school began operating and taught farming and ranching to the students. The U.S. Army Corps of engineers completed the Canton dam in 1948 and Tribal lands were lost to the Corp of Engineers. The Canton Tribal lands were reduced to 2,235 acres. 1,600 acres in the Canton Reserve will be included in this PCSC project. Perennialization of former crop land to native grass will take place in Canton on 650 acres. This will become pasture for regenerative bison grazing. As described below, in relation to our MMRV activities, the carbon content of this field will be measured before transition to pasture, and again three years later. 270 acres in the Canton Reserve are currently used as grass pasture for cattle. These lands will be transitioned from cattle to bison. 180 acres are considered the riparian area to Canton Lake. 500 acres of existing cropland will stay in crop rotations for supplemental bison feed. No-till and cover crop techniques will be used on this land. If water sources are added to these acres, they can be used for grazing paddocks with rotational grazing management.

One of the oldest towns in Western Oklahoma, Colony was founded in 1886 by John H. Seger. Seger started his work at the Darlington school and was later asked to establish a colony that would concentrate Indian families in agriculture communities. The Seger Colony was established in the South-central location of the Cheyenne and Arapaho Reservation along the fertile lands of Cobb Creek. John Seger built the federally funded Seger Industrial Training School in 1893. The school taught farming and industrial skills to Native Americans. The Seger Indian School became known as the model Industrial Indian School in the United States. 2,300 acres at the Colony Reserve will be included in the PCSC project.

Perennialization of former crop land to native grass will take place in Colony on 680 acres. This will become bison pasture. 1080 acres have most recently been grazed by cattle. These lands will be transitioned to bison pastures. Again, as described below, these fields will be subject to soil analyses prior to transition, and again at least three years later. While we do not expect the full carbon-sequestration gains to be evident in just three years, we do expect to see a signal in certain variables. In addition, adopting a chronosequence approach, we will also be sampling fields that have been under bison for at least five years, and comparing them with fields that have been under cattle for decades. In Colony, 320 acres are considered the riparian area to Cobb Creek and a pond. 100 acres are existing crop land will stay in crop rotations for supplemental bison feed. No-till and cover crop techniques will be used on this land. 120 acres are used for native grass hay fields.

In sum, the project will execute a range of changes in land use and agricultural practices in order to develop a demonstration of holistic climate-smart ranch management, centered

around regenerative grazing by bison. These changes include conversion of cropland to grassland replacement of cattle with bison, which will be managed following regenerative practices; reseeding with grassland species; removal of invasive trees and shrubs from grasslands, counterbalanced by the reforestation of riparian zones with native species; crop rotations and tillage transition to no till. Across three sites, our conversion of cropland will perennialize 2,300 acres. The management practices of the agriculture program are focused on regenerating Tribal lands back to productive native and locally adapted grasslands, characterized by a blend of native grasses, including big bluestem, little bluestem, indiangrass, switchgrass and eastern gamagrass. Native mixed grass stands will be the main forage resource for the Tribes' bison. These grasslands provide numerous ecosystem services beyond animal agriculture, including wildlife habitat, water storage resulting in greater climate resilience, and carbon sequestration.

When planning the implementation of practices (riparian restoration, native grass planting, animal integration, etc) the project team will consult the Oklahoma e-FOTG website for practice implementation guidance and standards. The implementation team will make adjustments during actual practice implementation according to field conditions, but will stay within the boundaries of practice guidance to the highest degree possible in a given circumstance. When needed, we will consult with local field office representatives on practice guidance and local/regional best practices. Consultation with contracted regional experts will also provide practice implementation guidance. In the course of this project, we will be guided by a panel of experts on regenerative grazing and bison management. One member of this panel will be drawn from Mad Agriculture, one from a regional soil-health organization, and one will be Tim Frasier, of Frasier Bison, a subawardee on this proposal.

In part III of this proposal, we will describe how sampling and analyses of soil cores, as well as flux-tower measurements, from fields subject to different management practices will support the development of a whole-operation ghg accounting of our demonstration project. These data will be vital to our outreach and communications efforts, described above, as well as to the verification program and justification of premium pricing for Verified Regenerative Bison Products, described below. Furthermore, by taking these measurements in three different prairie ecosystems under tribal management, we will further support the improvement of USDA Comet for American bison, as well as the scaling of the new Verified Regenerative Bison production to more ranches across the central plains.

iii. Parasitology and Bison Sequestration Systems

As we emphasized above, to be truly climate-smart means not only to reduce net ghg emissions but also to improve climate resilience and the capacity to adapt to changing conditions. One area of climate adaptation that may be dangerously under-appreciated at present concerns the effects of changing climate on parasite risks (9-11).

Regenerative grazing practices of bison to increase climate resilience will prove successful in its goals only if the bison are healthy. Keeping bison well-nourished and disease-free requires a parasitology program that is responsive to the new conditions introduced not only by climate change, but also by the new grazing practices we adopt to improve soil health and thus mitigate climate change. Healthy soils increase the density of grass stands, increasing retained moisture, and they may therefore enhance the development and transmission for Gastrointestinal Nematodes (GIN). Important parasites that pose a threat that may be enhanced by climate change are *Ostertagia, Haemonchus*, and *Dictyocaulus* species. The Southern Plains are a window into the future for the Northern Great Plains, where climate models predict change to warmer, wetter conditions more conducive for proliferation of certain parasites within 15 years' time. Fortunately, an adaptive parasitology program can track parasite loads, identify species present, and responsively formulate treatment and prevention options to address these parasitic diseases.

As an important component of our demonstration program, we will develop a climateadaptive parasitology program that combines citizen-science and observation with scientific analysis to provide management tools for bison producers. Accredited laboratory work and publication will be provided by Texas A&M University Parasitology Diagnostic Laboratory. The Texas Bison Parasitology Stakeholder Citizen Science & Observation Initiative (TXBPSCOI) will develop a handbook of technical procedures. TXBPSCOI and Mag Ag will be providing technical assistance for the grant recipient. The adaptive parasitology demonstration program will also encompass sequestration systems, which are a key strategy for preventing the spread of GIN and other parasites. Collaborators on this project will include Texas A&M University Parasitology Diagnostic Laboratory, Frasier Bison, Southwest Bison, and Wheeler Feeders FCCAI. The research from this collaborative program will provide management strategies and technical tools to equip future adopters of regenerative bison grazing practices to implement the parasitology programs needed as we adapt to climate change.

III. Measurement/quantification, monitoring, reporting, and verification plan (MMRV)

The MMRV component of this project will have four different but interrelated parts.

i. Quantification of the ghg emission reductions associated with conversion from conventional cattle grazing to regenerative bison grazing.

Recent research combining remote sensing with field observations has shown that bison can "engineer the green wave" (12). That is, their grazing alters the timing and speed of the spring green-up across prairies. Bison grazing causes grasslands to green faster, more intensely, and for longer duration. Cattle graze differently from bison (13), and therefore they are likely to have different effects on the dynamics of the green wave, and consequently on soil attributes

and other ecological variables. On evolutionary grounds, it is reasonable to hypothesize that native plant communities will thrive, and consequently sequester more carbon, under grazing that resembles the conditions under which they evolved, and North American grassland species evolved with American bison, not with cattle. Interestingly, the regenerative cattle ranching practice known as 'adaptive multi-paddock' (amp) grazing compels cattle to exhibit behaviors that closely resemble what bison instinctively do, namely localized grassland balding followed by tight herd movement. While poor grazing practices with bison, such as persistent overstocking, can certainly degrade grassland, the practice studied here—regenerative bison grazing—requires avoiding such mismanagement. In the sole available comparative study, regeneratively managed bison and amp-managed cattle resulted in higher soil carbon levels than conventionally managed cattle (*14*). While this study is intriguing, it represents a single geographic site and a limited sampling period, and therefore is not sufficient for quantification of the difference in grassland carbon sequestration that can result from regenerative bison grazing.

There is also evidence that bison emit less ghg's than cattle(15), as well as a mechanistic rationale to explain why this could be the case: In their diet mixing, bison are concentrate grazers; that is, they more actively select forbs, which are higher in secondary nutrients, including tannins, which may reduce methane as well as nitrous oxide emissions. However, as with soil-carbon sequestration, the data are not yet sufficient to make reliable general predictions about the overall ghg effects of bison versus cattle. The timeframe of the only study on this topic was relatively brief. In addition, novel methods for combining tracking of animals by camera with flux-tower detection of emissions should now facilitate more accurate emissions measurement (15-17).

In the research proposed here, we will measure the difference between bison and cattle in two important factors contributing to their total ghg emissions: sequestration of carbon by soils and direct animal emissions of methane. Our results will contribute directly to improving the forecasts offered by USDA Comet for the production of bison.

Over the past ten years, a number of tribal programs around the country have reintroduced bison to their former range. Most of these programs are members of the Intertribal Buffalo Council. Collectively, the ITBC programs present a unique opportunity to study the effects of bison grazing on carbon sequestration as well as ecological co-benefits, including insect and bird biodiversity, soil water storage, and grassland drought resilience. In work external to this proposal, Collaborative Earth is coordinating with ITBC to sample soils in grasslands that were converted from cattle to bison at known points in the past, ranging from over 10 years to just a few years, at sites of more recent introduction. Data from that work will be combined with the data generated in this project, as well as with data available in the literature, to create

a larger aggregated dataset for estimating the longer term effects of regenerative grazing by bison.

In this project, to contribute to our understanding of the effects of bison grazing on carbon sequestration, we will analyze soils in treatment and control fields at the start of the research project and then once again at least three years later. To be clear, we expect the signal of change in total organic carbon to be revealed primarily by comparison across fields with differing histories, rather than comparison across time points during our study. However, sampling twice will contribute to the total size of the dataset, potentially add information about changes on shorter time scales in certain soil variables, such as mineral-associated organic carbon, and inform the construction and parameterization of models of soils (*18, 19*).

Informed by remote analysis of DEMs, historical NDVI, other ecological variables, and soil maps, as well as on-the-ground soil surveys where needed, our team will make decisions about specific sampling sites and core depths, ranging from 30 cm to 2 m, depending on soil types and horizonization. Our team for this work will be led by Dr. Stephen Porder, who will be supported through consultation with Dr. Gisel Booman (leader of Collaborative Earth's Bison Lab), who is an expert in remote sensing of grasslands, and with Dr. Francesca Cotrufo (CSU and Cquester Labs), who is an expert on carbon and nitrogen cycling in the particular grasslands we are investigating.

We will calculate carbon stocks as a function of cumulative core mass, in addition to fixed depth (20). On average, across our 7 fields, we anticipate 100 cores per field, 4 depths sampled per core, for a total of 2,800 samples early in the grant period, and another 2,800 samples late in the grant period, over three years after the first sampling round. Soil analyses for all samples will be performed by Cquester Labs, Fort Collins, CO. Quantities to be measured in each sample include the following: bulk density, total percent carbon, total percent nitrogen, pH, texture with hydrometer, inorganic carbon (in samples exhibiting a positive fizz test), midinfrared spectroscopic profile, particulate organic matter and mineral-associated organic matter fractions. Methods that will be used are described in the following references: (18, 21-24). The ultimate goal of our soil sampling analyses is to quantify how bison affect the total carbon sequestered in soil over time; to do so rigorously will require us to measure a number of variables beyond total carbon stocks (18, 19), so that we can understand soil evolution and how it varies with depth (20). In addition, as we describe below, we will also be designing more efficient methods for monitoring soil carbon at scale, so that the extensive analysis described here will not be needed in future projects monitoring the effects of grazing methods in order to meet the requirements of the verification process we propose below.

To measure the methane emitted by bison under regenerative grazing management relative to cattle, Dr. Paul Stoy will lead a team to deploy two flux towers. These flux towers will be equipped to measure both CO_2 and CH_4 emissions. Towers will track animal locations and

movements, which can be integrated with micrometeorological observations to infer total CH₄ emissions from the animals (*15-17*). (Combining AI with 3D sensing by stereo cameras, the zed open-source software community has recently made significant progress in tracking animal movements in space.) The CO₂ measurements will provide valuable cross-reference data for the soil studies. The CH₄ measurements will enable us to estimate the total methane emitted by each herd. We will estimate the size of each animal in each herd at the start and finish of flux tower observation, providing more meaningful metrics, such as methane emitted per kg of total weight or protein accumulation.

In sum, the study proposed here will yield a quantitative estimate of ghg emissions by bison versus cattle under similar conditions and using the same measurement techniques. This data will inform USDA Comet and provide a baseline estimate of ghg reductions achieved by adopters of regenerative bison practices.

ii. Development of economical and scalable methods for assessing GHG impacts of grazing species and practices.

The analyses proposed in MMRV part i are too costly to form the basis of common practice for monitoring the benefits of regenerative bison grazing practices at scale. Therefore, we will design a sampling protocol that will leverage the analyses from this project and other research to reduce the measurements demanded from future adopters. We will reduce future measurement needs in three ways. First, to reduce the number of soil samples needed, the Bison Lab at Collaborative Earth, led by Dr. Gisel Booman, will develop machine-learning algorithms for interpolating soil carbon levels between sparse sampling points. Such reduction in sampling density will inevitably reduce accuracy, however the added variance can be quantified and kept within tolerance levels stipulated by international carbon registries (25). Second, our soil samples will be analyzed by MIR. MIR can substitute for full laboratory analysis, yet its accuracy varies with place and land use (26). We will contribute to the understanding of when and where MIR can be used without dramatic loss of accuracy. Third, we will trial Haystack Ag's cost-effective automated system for measuring soil organic carbon. To test measurements compared with the traditional analyses from Cquester, we will run one 400 of our 2,800 samples collected in our first collecting campaign through Haystack's automated system. Contingent upon Haystack achieving its goals of cost reduction through automation in the next three years, we will run half of our samples from our second collecting campaign through Haystack's automated system. In all cases, results from Haystack's analysis will be compared with the thorough "gold standard" of results from Cquester, to detect and quantify deviation between the methods. We view this duplication of analyses as a worthwhile investment, because Haystack's automation technology has the potential to reduce the total cost of future soil carbon analyses by an order of magnitude. Such a reduction would greatly facilitate our effort to establish an outcome-confirmed sustainable grazing verification program, as described below.

iii. GHG measurement and accounting in the expansion of the Cheyenne and Arapaho regenerative bison production program.

As described in part I of this proposal, the development of the Cheyenne and Arapaho demonstration program will involve four types of land-use conversion and regeneration: from cattle production to bison production using regenerative grazing practices; from dry-land cropping to bison production using regenerative grazing practices; from dry-land cropping to hay production with native perennial grass mixes; from cattle-degraded river bank to restored riparian habitat. The reductions in ghg emissions associated with all of these land-use conversions will be estimated through the collaborative work of our research team.

At the start of the project period, we will initiate our sampling protocol to measure the carbon content of soils prior to land use conversions. Land use changes will occur over the following two years. In year four of the project, we will repeat our sampling process in each site. Aggregating data from this project and other bison/cattle comparison studies, as described above, we will estimate the operation's overall ghg budget and forecast its changes over the decade to come. This information will flow into the enhanced value of products specifically linked to environmental improvements through the verified products described below.

We will also measure changes in climate resilience that result from the interventions. We expect such changes in several areas: microclimatic differences achieved through riparian restoration around Caddo Springs, as well as replanting of native trees in other locations; water storage and drought resilience resulting from riparian regeneration, as well as from reduction in soil compaction and increases in soil water-holding capacity; increases in grassland biodiversity, which improve ecological resilience in the face of climate change. Though these changes are often referred to as co-benefits, we view them as central to climate-smart improvements to rangeland management

iv. Creation of the world's first regenerative bison verification program.

Verification and certification programs can be a powerful way to reintegrate regional food systems and reconnect consumers with the people, places, and ecosystems that provide food. Successful programs of this kind have created trust between consumers and growers that share the same values. Such programs ensure that sustainability standards are being met through inspection, record keeping, and third-party verification. For example, the USDA Organic Program has enabled farmers to connect with consumers that will pay more for the "integration of cultural, biological, and mechanical practices that foster cycling of resources, promote ecological balance, and conserve biodiversity", with the USDA Organic or Verified Organic seal. The Global Animal Partnership (GAP) is another successful certification, this one focused on animal welfare. We propose that a program of this nature can be used to

connect procedures and consumers in ways that financially reward the ecological benefits of regenerative and climate-smart agriculture, and effectively create climate-smart commodities.

We will work with the Savory Institute and their new and exciting verification program. The Land to Market program is the first outcomes-based verified regenerative sourcing solution for both producers and buyers. The program primarily relies on the measurement and reporting of outcomes using Ecological Outcomes Verification (EOV), which allows producers that properly manage livestock to monitor the improvement of soil fertility, carbon sequestration, hydrologic function, and biodiversity. With Land to Market verification, producers can then access buyers, brands, retailers, and consumers.

Through our collaboration with the Savory Institute, we will create a *bison-specific* and *rigorously climate-beneficial* program leading to the first verified and certified regenerative bison products. The land-conversion and grazing practices implemented in our demonstration program will constitute a trial of practices that will enable ranchers to meet the outcome-based criteria for verified regenerative bison products. Meanwhile soil carbon and methane measurements conducted in this project, through a collaboration among the project partners, will support the development of more cost-effective methodologies for monitoring ghg outcomes resulting from grazing management. These methodologies will, in turn, integrate with and build on the EOV approach, creating greater rigor in measurement of outcomes and consequentially more reliable veracity of claims.

To clearly define the roles in our collaboration with Savory's Land to Market program: The partners of this project, including the tribal bison programs, Collaborative Earth, Frasier Bison, and Mad Agriculture will develop and ultimately define the practices and criteria for certification. These practices and criteria will be provided to Savory's Land to Market master verifies for their implementation in an already well-developed certification operation. We will work with Savory to ensure that added value will travel with the commodity through traditional, affidavit-based chain of custody and traceability mechanisms. We believe widespread adoption of our new bison-specific and climate-smart verification and certification will require that we begin with the simplest possible enhancement of existing mechanisms for tracing meat from producer to distributor to whole-seller to retailer. Carbon credits will not be created or sold in this process, however the value of verified carbon sequestration to conscientious consumers will be passed back to ranchers through a higher price commanded by verified products.

The demonstration project described in part I of this proposal will provide a powerful mechanism for outreach to ranchers, illustrating for them the financial as well as ecological benefits associated with obtaining the verification we will design in collaboration with the Savory Institute.

IV. Plan to develop and expand markets for climate-smart commodities

More and more consumers want to know where their food comes from, and what impact food has on the landscapes and communities where it is produced. With the rise of regenerative agriculture and the growing urgency to solve climate change, more and more buyers are committing to climate-smart agriculture and to sourcing from regenerative farms as a way of fulfilling that commitment. A wide variety of consumer packaged goods companies are leading the way, from small (e.g., Patagonia Provisions) to large (e.g., Applegate), from international (e.g. Unilever) to domestic (i.e. General Mills). Consumers are ultimately driving this trend along with corporate shareholders in whose companies that desire and mandate are driving adoption of climate-oriented goals. Major brands are not only faced with the challenge of dealing with emissions that occur outside of their operations but within their supply chain (Scope 3 greenhouse gas emissions).

Mad Agriculture's Markets Program helps farmers connect with value-aligned buyers, and vice versa. Mad Ag primarily works with consumer packaged goods (CPGs) brands who have made commitments to regenerative sourcing and climate action goals. We help facilitate and build long-term relationships between producers and buyers based on a shared vision and commitment. Mad Ag works on behalf of producers to broker deals with buyers, and works on behalf of CPGs to originate new supply for their products. Mad Ag currently works with over 90 producers in 16 states who collectively manage over 75,000 acres of land. For this project, Mad Agriculture will hire a bison markets specialist to focus on full 'hoof to horn' utilization to sell multiple products, including specialty cuts, ground bison, jerky cuts, hides, and bone meal.

The bison-specific verification program created within Savory Institute's Land to Market program will provide the basis for market differentiation and added value to both producer and CPG partners. In reality, the market will determine the actual value, but we will target a 20% premium for certified bison over non-certified bison; these prices will not be directly tied to cattle prices. We are in active conversation with a variety of buyers, including: Nose to Tail, Moink, Whole Foods, Epic Provisions (General Mills), Rep Provisions, Patagonia Provisions, Figure 8 Foods and Applegate. The bison-specific verification developed in this project is the first for bison and will become available to producers not directly involved in this grant, and will remain as a market differentiator beyond the duration of this grant period. The scientific protocols and methodologies for the bison certifications.

The processors of the product will follow Land to Market protocols and Ecological Outcome Verification. Common chain of custody protocols will be followed to track certified products through the supply chain. Carbon and climate beneficial metrics will be taken during the

certification process but will not be fractionalized to be sold with the products into the marketplace. To avoid double counting, producers will agree to not sell the carbon beneficial metrics as credits or offsets, but use the data only for certification and management purposes.

The acreage involved in the demonstration program, which is summarized in the table above, is in a wide range of different conditions, and committed to a variety of different land uses. To model each soil condition x land-use-conversion combinations individually would at this stage involve microgeographic assessment of current carbon levels. However, we can make reasonable assumptions based on average sequestration rates due to prairie restoration of multiple current land-uses, including annual crops and hayed grassland, as summarized in Paustian et al (2019) (see project narrative reference 3). Assuming an average rate of carbon sequestration due to prairie restoration of 0.9 t CO2/acre/year, we extrapolate from the acreage table above to the ghg sequestration forecasts shown here. Please note that quarterly benchmarks are linearly interpolated from annual benchmarks. Because of the seasonality of carbon sequestration, we do not actually expect carbon sequestration to follow this precise path, but annual estimates should be reasonable.

We will also be including CH4 emissions in our assessments of total ghg benefits of this project. However, the relative methane emissions of cattle versus bison is one key unknown, making quantitative forecasting at this stage impossible. We anticipate gaining important information on this variable from the flux tower measurements taken as part of this project.

	Number of New Marketing Channels Established

Year 3	2	2	2	2	
Year 4	2	2	12	12	

• Number of measurement tools utilized:

Explain

In Q1, the CE research fellows will visit the project site to plan flux tower installation and soil core sampling. In Q2, camera-equipped flux tower installation and the first round of soil core sampling will take place. Eddy-covariance sensors will measure CO2 and CH4 fluxes, and cameras will enable

more accurate attribution of fluxes to local livestock. The soil cores drawn in Q2 will be subject to laboratory analyses in Q2 and Q3. Soil analyses will include bulk density, percent C and percent N, fizz test to determine presence of inorganic carbon, inorganic carbon levels when necessary, total organic carbon, including fractionation of soil organic carbon into particulate organic matter and mineral-associated organic matter, and pH (a total of 8 soil measurements). The reason for measuring all of these variables is that they will enable us to understand changes in total soil carbon and ultimately to predict how soils will respond over time to shifts to regenerative practices by future adopters. The ultimate goal is to design lower-cost methods for mmrv by future adopters of verified regenerative bison production. Importantly, we will also perform Mid-IR spectroscopic analysis of soil cores (a 9th measurement), determining whether MidIR will be a viable, lower cost tool for future adopters to measure soil carbon levels. Finally, we are counting analysis by Haystack Ag as a 10th measurement, although the variables measured are overlapping with those measured by more conventional methods. The reason for subjecting 100 out of 700 cores to redundant measurement at this stage is to trial the automated methods of Haystack Ag for accuracy, speed, and cost.

Q2 and Q3 soil core results will provide vital baseline measurements for the effects of the demonstration project on ghg sequestration. They will also contribute to a large database facilitating comparison of the effects of bison versus cattle effects on soils. We are not anticipating a second round of soil core sampling until Q3 and Q4 of year 4; our intention is to wait as long as possible between core sampling rounds, as the accumulation of organic matter in soils is a relatively slow process. During all intervening quarters, the flux tower measurements of CO2 and CH4 will be ongoing.

Year 4	1	2	2	1

Other Required Benchmarks that may be quantitative or qualitative:

• Outreach, training and other technical assistance:

Our outreach and training strategy will focus on presenting at conferences and hosting on-site workshops/field days at the demonstration project. We will present at conferences or host online webinars during Q1 and Q4 of each year, and host on-site field days in Q3 and Q4. Possible conferences, which we already actively attend, may include Marbelseed, EcoFarm, Grassfed Exchange, Regenerate, Holistic Management International, Regenerative Agriculture and Foods Systems Summit, and others. For field-days, in Years 2, 3 and 4, we will host a field day in the spring and summer focused on sharing regenerative systems design, practices, progress and economics aimed at educating other producers. In Year 4, we will host a field specifically for brands and buyers that are interested in sourcing certified regenerative raised bison. Every year in Q2, we will also host a field day for the tribal community.

Year 4				

MMRV -

In Year 2, we will begin to develop the Regenerative Bison certification in partnership with the Savory Institute, and we will likely envelope the standard within their Ecological Outcome Verification (EOV) program, which in turn, enables us to enter their Land to Market sales program. In Year 3, we will begin to cultivate relationships with prospective buyers and begin to develop supply chains from field to process and distribution to sales. Traceability is critical for the success of this project and for the certification. Traceability is a system of identification that allows tracking of location and movement of animal products. We will follow industry standards to design, develop and implement regenerative supply systems.

Othe	r Measurements of	Work Related to	Marketing of C	ommodities
	1 st Quarter	2 nd Quarter	3 rd Quarter	4 th Quarter
Year 1	0	0	0	0
Year 2	0	0	0	0
Year 3	0	1	2	3
Year 4	3	3	6	6

• Other measurements of work related to marketing of commodities:

In Year 3 we will begin aligning buyers and establishing purchasing contracts for the regenerative raised bison. We will originate 3 buyers in Year 3 and 3 more buyers in Year 4, for a total of at least 6 buyers of regenerative certified bison. Most of our marketing will be direct outreach to buyers that we already have established relationships with.

Climate-Smart Practices and Limitations

NRCS Practice Code	Practice Name
380	Windbreak/Shelterbelt Establishment and Renovation
382	Fence
390	Riparian Herbaceous Cover
391	Riparian Forest Buffer
393	Filter Strip
512	Pasture and Hay Planting
528	Prescribed Grazing
550	Range Planting
590	Nutrient Management
612	Tree/Shrub Establishment

Climate-Smart practices under this grant shall be limited to the following practices:

All practices applied under this grant will follow NRCS practice standards unless noted below:

In occasional circumstances, field conditions or available seed varieties may require that practice implementation varies slightly from the NRCS Conservation Practice Standard. These situations will be avoided wherever possible. If deviations are needed, the application will adhere to the principles of the practice standard as closely as possible and will avoid activities such as planting invasive weed seeds or over-application of nutrients that may cause damage to the land base or its resources. Prior to any deviations from the NRCS Conservation Practice Standard, notification of different practices planned will be provided to USDA and approval from USDA will be obtained for the deviations to the NRCS practices prior to project implementation.

Overview of Reporting Requirements

Grant recipients are required to submit reports to document their performance under the Partnerships for Climate-Smart Commodity funding opportunity. These submissions will be required to use the Microsoft Excel workbook templates provided by USDA. The workbooks contain a series of worksheets that collect data in a standardized format to ensure data quality and allow for aggregation and summary of this information. The entire workbook must be submitted quarterly, with updates to all applicable worksheets. This guide is divided into three sections. The Overview of Reporting Requirements section summarizes the layout of the reporting workbook and presents the data elements included in each worksheet. It also describes additional documents that must be submitted to supplement the performance reports. The Data Definitions section provides descriptions and allowable response options for each data element. The guide also indicates whether each data element is required, applicable at times, or optional; as well as how frequently each data element must be updated. Finally, the Appendices contain practice and commodity lists that will be used for these reports. Reporting is necessary for USDA oversight of this effort. The data elements required for inclusion in the quarterly performance reports allow USDA to conduct selected audits to review whether producers are receiving federal funds from multiple sources for the same purpose; to determine whether GHG benefits from implementation of climate-smart agriculture and forestry (CSAF) practices are being estimated accurately; and for other purposes deemed appropriate by USDA.

The reporting worksheets collect information at four levels: project, partner, producer, and field. Descriptions of each level:

Project level: Information about activities and impacts at a whole project/aggregate level (i.e., reflecting all activities under the grant agreement). Some project-level reporting is further subdivided by commodity type or a combination of commodity and CSAF practice(s) (commodity x practice). **Partner level:** Information about activities related to a single organization (recipient, subrecipient, contractor, or other partner) within a project.

Producer level: Information about individual producers who have one or more farms enrolled in a project. **Field level**: Information about individual fields enrolled in a project.

Certain data elements are required to be reported for each producer and field enrolled in a project. In order to minimize the burden associated with data collection and to enable USDA to match data to existing records, these producer- and field-specific records must use the producer's established FSA Farm, Tract and Field IDs, and report the State and County associated with the Farm ID. Associated data entered in conjunction with these data elements, such as Producer Name, must match the data contained in the customer's Business Partner record, and the Farm Operating Plan in Business File for that Farm ID. Disclosure of this information is protected under Section 1619 of the Food, Conservation, and Energy Act of 2008 (PL 110- 246), 7 U.S.C. 8791. Additionally, Departmental Regulation 4370-001 provides USDA's policies for collecting demographic data, including race, ethnicity and gender. Providing demographic information is voluntary and at the discretion of the customer. Demographic information is used by USDA for statistical purposes only and will not be used to determine an applicant's eligibility for programs or services for which they apply.

Note: For purposes of this guide, "farm" refers to the operation from which climate-smart commodities are produced and may represent farms, ranches, forests or other operations. Similarly, "field" refers to the individual land units at which climate-smart practices are being implemented to produce climate-smart commodities and may represent lots, farmsteads or other units, depending on the type of operation and commodity. The use of "Farm", "Tract" and "Field" align with the FSA definitions; for example, "A field is a part of a farm that is separated from the balance of the farm by a permanent boundary, such as; fences, permanent waterways, woodlands, croplines in cases where farming practices make it probable that this cropline is not subject to change, and other similar features."

The following tables list the data elements included in each reporting worksheet, along with a brief description of each item.

Project Summary

These data will be collected about each project. Cumulative results are reported each quarter. Report last quarter's entry if there has been no change in this quarter.

Data element name	Description	Frequency
Commodity type	Type of commodity(ies) incentivized by the project	Quarterly
Commodity sales	Indicates sales of the commodity(ies) related to the project occurred this quarter	Quarterly
Farms enrolled	Indicates enrollment activities occurred this quarter	Quarterly
GHG calculation methods	Methods used to calculate greenhouse gas (GHG) benefits	Quarterly
GHG cumulative calculation	Method used to calculate cumulative GHG benefits	Quarterly
Cumulative GHG benefits	Whole project estimate of total GHG (CO2e) emission reductions	Quarterly
Cumulative carbon stock	Whole project estimate of total carbon sequestration	Quarterly
Cumulative CO2 benefit	Whole project estimate of total CO2 emission reductions	Quarterly
Cumulative CH4 benefit	Whole project estimate of total CH4 emission reductions	Quarterly
Cumulative N2O benefit	Whole project estimate of total N2O emission reductions	Quarterly
Offsets produced	Amount of carbon offsets produced by project	Quarterly
Offsets sale	Name of marketplace where carbon offsets were sold	Quarterly
Offsets price	Price of carbon in offset sales	Quarterly
Insets produced	Amount of carbon insets produced by project	Quarterly
Cost of on-farm TA	Cost of on-farm technical assistance (TA) provided to producers	Quarterly
MMRV cost	Cost of measurement, monitoring, reporting, and verification (MMRV) activities	Quarterly
GHG monitoring method	Methods used by project to monitor GHG benefits (up to 5)	Quarterly
GHG reporting method	Methods used by project to report on GHG benefits (up to 5)	Quarterly
GHG verification method	Methods used to verify GHG benefits (up to 5)	Quarterly

Table 1. Project Summary elements

Partner Activities

These data will be collected at the project level. Each row in this worksheet will represent one organization involved in the project, including the recipient and all contributing partners. A partner is any organization that is receiving project funds or providing matching contributions (funds or in-kind contributions) to the project. While the recipient must complete one row for their own organization, not all data elements apply to the recipient. These exceptions are noted in the detailed descriptions of the specific elements in the *Data Definitions* section of this guide. Data are reported cumulatively each quarter. Report last quarter's entry if there has been no change in this quarter.

Data element name	Description	Frequency
Partner ID	Unique ID for each partner	One-time
Partner name	Name of partner organization	One-time
Partner type	Type of organization	One-time
Partner POC	Partner point of contact name	As applicable
Partner POC email	Partner point of contact email	As applicable
Partnership start date	Start of partnership on project	One-time
Partnership end date	End of partnership on project	As applicable
New partnership	Indicator for partner organizations that have no prior work with the recipient	As applicable
Partner total requested	Total amount requested to date by partner from recipient	Quarterly
Total match contribution	Total amount of match contribution by partner to date	Quarterly
Total match incentives	Total amount of match contribution by partner for incentives	Quarterly
Match type	Top 3 types of match contribution by partner, other than incentives	Quarterly
Match amount	Value of match contributions by type	Quarterly
Training provided	Top 3 types of training provided to the partner through project	Quarterly
Activity by partner	Top 3 types of activities provided by this partner to producers or other partners	Quarterly
Activity cost	Approximate cost per activity type provided by partner to producers or other partners	Quarterly
Products supplied	Names of products supplied to producers as part of project activities or incentives	Quarterly
Product source	Supplier or source of products supplied to producers as part of project activities or incentives	Quarterly

Table 2. Partner Activities elements

Marketing Activities

....

-

These data will be collected at the project level. Each row in this worksheet will correspond to one commodity for which the project enrolls fields and one marketing channel used to sell that commodity by the project or producers enrolled in the project. Data are reported for the current quarter and are not cumulative. If no sales of the commodity were reported during a quarter, do not complete this worksheet for that quarter.

Data element name	Description	Frequency
Commodity type	Type of commodity incentivized by the project	Quarterly
Marketing channel type	Type of marketing channels used	Quarterly
Number of buyers	Number of buyers per marketing channel	Quarterly
Names of buyers	Names of buyers in the marketing channel	Quarterly
Marketing channel geography	Geography of marketing channel	Quarterly
Value sold	Value of commodity sold by marketing channel	Quarterly
Volume sold	Volume of commodity sold by marketing channel	Quarterly
Price premium	Price premium of commodity by marketing channel	Quarterly
Price premium to producer	Percent of price premium that goes to the producer	Quarterly
Product differentiation method	Top 3 types of product differentiation methods used	Quarterly
Marketing method	Top 3 types of marketing methods used	Quarterly
Marketing channel identification method	Top 3 ways marketing channel was identified	Quarterly
Traceability method	Top 3 types of supply chain traceability methods used	Quarterly

Producer Enrollment

These data will be collected at the producer level about each farm enrolled in the project. In this worksheet, each row will correspond to one farm that has at least one field enrolled in the project. Data are reported when a producer first enrolls one or more fields in the project. If a producer is enrolled in the project for multiple years, review the farm characteristics each time a new contract is signed and provide any necessary updates. The quarterly submission should contain information about each farm initially enrolled in the project during that quarter and for updates to farms that have re-enrolled during that quarter, as applicable. If no farms are enrolled during that quarter, do not complete this worksheet for that quarter.

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
State or territory	State name (must match FSA farm enrollment data)	
County of residence	County name (must match FSA farm enrollment data)	
Producer data change	Indicator that producer data was updated at re-enrollment	As applicable
Producer start date	Contract start date	Enrollment
Producer name	Name of primary operator	Enrollment
Underserved status	Indicator the primary operator is considered underserved and/or a small producer	Enrollment
Total area	Total area of enrolled operation	Annual
Total crop area	Total crop area in enrolled operation enrolled	Annual
Total livestock area	Total livestock confinement, pasture and rangeland in enrolled operation	Annual
Total forest area	Total forest area in enrolled operation	Annual
Livestock type	Top 3 types of livestock on enrolled operation	Annual
Livestock head	Total livestock currently managed (by type)	Annual
Organic farm	Indicator that part of the farm is certified or transitioning organic	Annual
Organic fields	Indicator that any of the enrolled fields are certified or transitioning organic	Annual
Producer motivation	Motivation for participation	Annual
Producer outreach	Top 3 types of outreach provided to producer	Annual
CSAF experience	Indicator of prior implementation of CSAF practices at this farm	Annual
CSAF federal funds	Indicator of prior receipt of federal funds for CSAF practices	Annual
CSAF state or local funds	Indicator of prior receipt of state funds for CSAF practices	Annual
CSAF nonprofit funds	Indicator of prior receipt of nonprofit funds for CSAF practices	Annual
CSAF market incentives	Indicator of prior receipt of market incentives for CSAF practices	Annual

Table 4. Producer Enrollment elements

Field Enrollment

These data will be collected about each field enrolled in the project. In this worksheet, each row corresponds to one field x commodity combination enrolled in the project. Generally, data are reported once for each field, at its initial enrollment. The quarterly submission should contain information about each field initially enrolled in the project during that quarter. If no fields are enrolled during that quarter, do not complete this worksheet for that quarter. If a field is enrolled for multiple years, any relevant changes, such as a new ID number or changes to the commodity or practice combinations should be entered in this worksheet during the quarter it is re-enrolled, or as applicable.

Data element name	Description
Farm ID	Unique Farm ID assigned by FSA
Tract ID	Unique Tract ID assigned by FSA
Field ID	Unique Field ID assigned by FSA
State or territory of field	State name
Physical County of field	Physical county name must match FSA farm records
Prior Field ID	Previous Field ID when reconstitution of farm results in new Field IDs
Field data change	Indicator that field data has changed from initial enrollment
Contract start date	Start date of contract
Total field area	Size of enrolled field
Commodity category	Category of commodity(ies) produced
Commodity type	Type of commodity(ies) produced
Baseline yield	Average yield of commodity in 3 years prior to enrollment
Baseline yield location	Location for which baseline yield is provided
Field land use	Most common land use in field in past 3 years
Field irrigated	Most common irrigation type in field in past 3 years
Field tillage	Most common tillage in field in past 3 years
Practice past extent - farm	Extent of operation that implemented this practice prior to project enrollment
Field any CSAF practice	Indicator for prior CSAF practices in this field in past 3 years
Practice past use - this field	Indicator of prior use of this practice in this field in the past 3 years
Practice type	CSAF practice(s) that will be implemented in enrolled field (up to 7)
Practice standard	Organization that developed CSAF practice standard implemented in field
Planned practice implementation year	Year that practice is planned to be implemented
Practice extent	Area or number of animals for which practice is implemented
Follow-on questions	Follow-on questions by practice type (see Table 11)

Farm Summary

These data will be collected about each farm enrolled in the project. In this worksheet, each row will correspond to one farm that has at least one field enrolled in the project. The quarterly submission should contain updates to any data elements that have changed for each farm enrolled in the project during that quarter. If there are no changes from the previous quarter, do not complete this worksheet for that quarter. Data are not cumulative.

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
State or territory	State name	
County of residence	County name	
Producer TA received	Type of technical assistance provided to producer	Quarterly
Producer incentive amount	Total financial incentive provided to the producer	Quarterly
Incentive reason	Top 4 reason(s) for financial incentives provided to producer	Quarterly
Incentive structure	Top 4 units on which financial incentives are structured	Quarterly
Incentive type	Top 4 type(s) of financial incentives provided to producer	Quarterly
Payment on enrollment	Extent of payment provided to producer upon enrollment	Quarterly
Payment on implementation	Extent of payment provided to producer upon implementation of CSAF practices	Quarterly
Payment on harvest	Extent of payment provided to producer upon harvest or slaughter	Quarterly
Payment on MMRV	Extent of payment provided to producer upon reporting or verification	Quarterly
Payment on sale	Extent of payment provided to producer upon sale of commodity	Quarterly

Table 6. Farm Summary elements

Field Summary

These data will be collected about each field enrolled in the project for a commodity x practice(s) combination. In this worksheet, each row will correspond to one field x commodity x practice(s) combination enrolled in the project. Data for each field will be reported quarterly and are not cumulative. Report data for any elements that have an update in that quarter. Greenhouse gas benefit estimates must be entered upon practice completion or annually, as appropriate. If there are no changes from the previous quarter, do not complete this worksheet for that quarter. This worksheet includes a section to report the "official" estimate of GHG benefits – amounts of greenhouse gas emissions reduced and carbon sequestered – for the field. These quantities refer to the estimates that are used to calculate the project's aggregate impact (reported in Table 1). Tables 8 and 9 are used to report alternate estimates of the field-level GHG benefits when additional methods are used to model (Table 8) or measure (Table 9) these impacts. Any field that can use COMET-Planner must submit those results, either as the official or alternate model.

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
Tract ID	Unique Tract ID assigned by FSA	
Field ID	Unique Field ID assigned by FSA	
State or territory of field	State name	
County of field	County name	
Commodity type	Type of commodity produced from field	Quarterly
Practice type	Type of practice(s) incentivized in field (up to seven)	Quarterly
Date practice complete	Date that practice implementation is certified complete	Quarterly
Contract end date	End date of contract	Quarterly
MMRV assistance provided	Indicator that MMRV assistance is provided to field	Quarterly
Marketing assistance provided	Indicator that marketing assistance provided for commodity from field	Quarterly
Incentive per acre or head	Indicator that a per acre/head incentives is provided for the CSAF practice(s) on this field	Quarterly
Field commodity value	Value of commodity produced from field	Quarterly
Field commodity volume	Volume of commodity produced from field	Quarterly
Cost of implementation	Total cost of practice implementation in field	Quarterly
Cost coverage	Percent of total cost of implementation of practice covered by project incentives	Quarterly
Field GHG monitoring	Methods used to monitor GHG benefits in field (up to 3)	Quarterly
Field GHG reporting	Methods used to report on GHG benefits for field (up to 3)	Quarterly
Field GHG verification	Methods used to verify GHG benefits for field (up to 3)	Quarterly
Field GHG calculations	Methods used to calculate GHG benefits for field	Quarterly
Field official GHG calculation	Method used to calculate official GHG benefits for field	Quarterly
Field official GHG ER	Official estimate of total GHG emission reductions for field	Quarterly
Field official carbon stock	Official estimate of total carbon sequestration for field	Quarterly
Field official CO2 ER	Official estimate of total CO2 emission reductions for field	Quarterly
Field official CH4 ER	Official estimate of total CH4 emission reductions for field	Quarterly
Field official N2O ER	Official estimate of total N2O emission reductions for field	Quarterly
Field offsets produced	Amount of carbon offsets produced in field	Quarterly
Field insets produced	Amount of carbon insets produced in field	Quarterly
Other field measurements	Indicator that field data was collected for reasons other than GHG benefit estimation	Quarterly

Table 7. Field Summary elements

GHG Benefits - Alternate Modeled

If greenhouse gas benefits are modeled for the same field using multiple methods, the results for the alternate models are reported in this worksheet. The "alternate" models refer to those model results that were not used in the calculation of the project's aggregate impact (as reported in Table 1). Any field that can use COMET-Planner must submit those results, either as the official or alternate model. These data will be collected about the modeled GHG benefits for each field x commodity x practice(s) combination. In this worksheet, each row will correspond to one field enrolled in the project. Data are not cumulative. Each quarterly submission should include information for all fields that have new modeled data. Greenhouse gas benefit estimates must be entered upon practice completion or annually, as appropriate.

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
Tract ID	Unique Tract ID assigned by FSA	
Field ID	Unique Field ID assigned by FSA	
State or territory of field	State name	
County of field	County name	
Commodity type	Type of commodity(ies) produced from the field (up to 6)	Annual
Practice type	Type of practice(s) incentivized in field (up to 7)	Annual
GHG model	Model used to calculate GHG benefits	Annual
Model start date	Start date of model run	Annual
Model end date	End date of model run	Annual
Total GHG benefits estimated	Estimate of total GHG benefits for field	Annual
Total carbon stock estimated	Estimate of total change in carbon stock for field	Annual
Total CO2 estimated	Estimate of total CO2 emission reductions for field	Annual
Total CH4 estimated	Estimate of total CH4 emission reductions for field	Annual
Total N2O estimated	Estimate of total N2O emission reductions for field	Annual

Table 8. GHG Benefits - Alternate Modeled elements

GHG Benefits - Measured

Projects must report the results of any carbon stock or greenhouse gas emission measurements in this worksheet. These data will be collected at the field level. Each row will represent a separate measurement method used to calculate GHG benefits for a given field. Data are reported once per year of measurement and are not cumulative. Each quarterly submission should include information for any field for which there are new soil samples or new calculations of annual GHG benefits based on actual measurements.

Data element name Description Frequency Farm ID Unique Farm ID assigned by FSA Tract ID Unique Tract ID assigned by FSA Field ID Unique Field ID assigned by FSA State name State County County name GHG measurement method Method of measurement Annual Lab name Entity that conducted analysis Annual Measurement start date Start date of measurements Annual Measurement end date End date of measurements Annual Total CO2 reduction calculated Calculation of total CO2 reduction Annual Total carbon stock change calculated Calculation of change in carbon stock Annual Total CH4 reduction calculated Calculation of total CH4 reduction Annual Total N2O reduction calculated Calculation of total N2O reduction Annual Numeric result from soil sample Annual Soil sample result Type of analysis conducted Annual Measurement type

Table 9. GHG Benefits - Measured data elements

Additional Environmental Benefits

Projects that track additional environmental benefits (e.g., water quality improvements) from enrolled fields report results in this worksheet. These data will be collected about each field. Each row in this worksheet will correspond to an enrolled field. Data are not cumulative. Estimates of environmental benefits must be entered upon practice completion or annually, as appropriate.

Table 10. Additional Environmental Benefits elements

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
Tract ID	Unique Tract ID assigned by FSA	
Field ID	Unique Field ID assigned by FSA	
State	State name	
County	County name	
Environmental benefits	Indicator that project tracks other environmental benefits	Annual
Reduction in nitrogen loss	Indicator that project tracks reductions in nitrogen loss	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Reduction in phosphorus loss	Indicator that project tracks reductions in phosphorus loss	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Other water quality	Indicator that project tracks other water quality improvements	Annual
Туре	Type of water quality metric being tracked	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Water quantity	Indicator that project tracks reduced water use	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Reduced erosion	Indicator that project tracks reductions in soil erosion	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Reduced energy use	Indicator that project tracks reductions in energy use	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Avoided land conversion	Indicator that project tracks reductions in land conversion	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Improved wildlife habitat	Indicator that project tracks improvements in wildlife habitat	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual

Supplemental Data Submission

Project MMRV Plan

Definition of MMRV elements:

Measurement: Quantification of the greenhouse gas benefits (reduction or capture) using mathematical models and/or direct physical measurements in the field

Monitoring: Ongoing review and confirmation that the climate-smart practice has been implemented according to the agreed upon standard and documentation of any changes in the site, implementation, or GHG emissions impacts over time

Reporting: Documenting and sharing monitoring and measurement results with project partners, the recipient, and any third-party verification organization

Verification: Independent confirmation that measurement, monitoring and reporting information are complete, accurate and reliable.

Projects must submit an MMRV plan that includes details about how each of the following are addressed:

- Quantification approach, including:
 - o GHG models used
 - o GHG measurement plan (if applicable)
 - Approach to quantifying additional environmental benefits, if applicable (e.g., water quality, habitat)
- Verification approach:
 - Compliance criteria
 - Verification plan/methodology
- Approach to ensuring:
 - o Additionality
 - o Permanence
 - o Leakage
 - Impacts of weather
- Plan for non-compliance

If the project is using a specific MMRV methodology or approach developed by the recipient, a project partner, or an outside organization, the project can submit documentation associated with the methodology as long as the documentation addresses each of the above categories.

If the project is tracking other environmental benefits (as reported in the *Additional Environmental Benefits* worksheet), include a description of the methodology and tools used to track and report on these benefits.

Field modeled GHG benefit reports

Results from any models besides COMET-Planner used to estimate GHG benefits must also be submitted as a separate report. This includes projects running COMET-Farm. The full results of any model can be submitted in the native/standard format generated by the modeling tool and must include the following Unique IDs in the report or in the file name: State, County, Farm ID, Tract ID, Field ID.

Field direct measurement results

For any direct physical measurements in the field, measurement results must be submitted as a separate report and must include the following Unique IDs in the report or in the file name: State, County, Farm ID, Tract ID, Field ID. Measurement results reports must include the name of the equipment used for sampling or data collection, the name of the lab that analyzed the data, and the analytical method used.

Sample report types include soil analysis reports, summarized results of portable emissions analyzers or flux towers, water quality analyses, and plant species counts. These could be collected for the purposes of determining GHG emission reductions or carbon sequestration amounts, for calibration of tools or models, for tracking other environmental benefits, or for other reasons.

Data Descriptions

This section provides descriptions and allowable response options for each data element. The guide also indicates whether each data element is required, applicable at times, or optional; as well as how frequently each data element must be updated.

Unique IDs

Project ID: Unique ID at the project level – "Award Identifying Number" shown on award documentation Partner ID: Unique ID at the partner level – use EIN; if no EIN, a unique ID will be assigned for use in these reports State or territory of operation: State or territory name County of operation: Physical county name

Farm ID: Unique ID at the operation level assigned by Farm Service Agency (FSA)

Tract ID: Unique ID at the tract level assigned by FSA

Field ID: Unique ID at the field level assigned by FSA

Project Summary

Commodity type	
Data element name: Commodity type	Reporting question: What climate-smart commodity types are produced by this project?
Description: Type of commodity incentiviz	zed by the project. These commodities include those for whom
5 87 A	r other types of marketing support. See full list of commodity options

Offsets price	
Data element name: Offsets price	Reporting question: What was the average price of carbon received for offsets?
Description: Average price per metric ton pa	id for carbon offsets produced by enrolled project fields. Offsets are
	using an accepted standard and sold into the carbon marketplace.
Data type: Decimal	Select multiple values: No
Measurement unit: Dollars per metric ton	Allowed values: 0-500
Logic: Respond if >0 to 'Offsets produced'	Required: Yes
Data collection level: Project	Data collection frequency: Quarterly
Insets produced	
Data element name: Insets produced	Reporting question: How many carbon insets have been produced in the project?
	enrolled fields during the quarter. Insets are defined as having
The second s	standard and accounted for within Scope 3 emissions for a firm.
Data type: Decimal	Select multiple values: No
Measurement unit: Metric tons CO2eq	Allowed values: 0-10,000,000
Logic: None – all respond	Required: Yes

Cost of on-farm TA	
Data element name: Cost of on-farm TA	Reporting question: What is the total amount that has been spent to provide on-farm TA?
and the state of the second of the second	tice-specific technical assistance provided by the project (by recipien ed quarterly. If there are no changes, enter the same number as the
Data type: Decimal	Select multiple values: No
Measurement unit: Dollars	Allowed values: \$0-\$50,000,000
Logic: None – all respond	Required: Yes
Data collection level: Project	Data collection frequency: Quarterly
MMRV cost	
Data element name: MMRV cost	Reporting question: What is the total amount that has been spent on MMRV activities?
Deceription: Total cost of all MMAN/ activity	as naid for by the project (recipient or partners) MMPV company

Description: Total cost of all MMRV activities paid for by the project (recipient or partners). MMRV components are defined as measurement (calculations or estimations of GHG emissions), monitoring (ongoing review and confirmation that the climate-smart practices have been implemented according to the agreed upon standard and documentation of any changes in the site, implementation, or GHG emissions impacts over time), reporting (documenting and sharing monitoring and measurement results with project partners, the recipient, and any third-party verification organization), and verification (independent confirmation that measurement, monitoring and reporting information are complete, accurate and reliable). This is updated quarterly. If there are no changes, enter the same number as the previous quarter.

GHG monitoring method		
Data collection level: Project	Data collection frequency: Quarterly	
Logic: None – all respond	Required: Yes	
Measurement unit: Dollars	Allowed values: \$0-\$50,000,000	
Data type: Decimal	Select multiple values: No	

Data element name: GHG monitoring 1-5 Reporting question: How did the project monitor GHG benefits?

Description: Up to the five most common forms of monitoring GHG benefits used this quarter as part of MMRV requirements. Monitoring is defined as ongoing review and confirmation that the climate-smart practice has been implemented according to the agreed upon standard and documentation of any changes in the site, implementation, or GHG emissions impacts over time. Include up to 5 methods, based on which methods are most commonly used for this project. The worksheet provides five columns with a drop-down list of the allowed values. Choose one value for each column. If fewer than 5 GHG monitoring methods are used, leave unnecessary columns blank. If "other" is chosen, use the additional column to enter other GHG monitoring methods as free text.

GHG reporting method

Data element name: GHG reporting 1-5

Reporting question: How did the project track and report implementation of practices to reduce GHG emissions?

Description: Up to the five most common forms of tracking and reporting on practice implementation used this year as part of MMRV requirements. Reporting is defined as documenting and sharing monitoring and measurement results with project partners, the recipient, and any third-party verification organization. Include up to 5 methods, based on which methods are most commonly used for this project. The worksheet provides five columns with a drop-down list of the allowed values. Choose one value for each column. If fewer than 5 GHG reporting methods are used, leave unnecessary columns blank. If "other" is chosen, use the additional column to enter other GHG reporting methods as free text.

ractice extent unit	
Data element name: Practice 1-7 extent unit	Reporting question: Unit for extent of practice implementation
Description: Unit for extent of practic	ce implementation on the field specified by the contract. If "other" is
chosen, use the additional column to	enter the appropriate unit.
Data type: List	Select multiple values: No
Measurement unit: Category	Allowed values:
	Acres
	 Head of livestock
	Linear feet
	Square feet
	Other (specify)
Logic: None – all respond	Required: Yes
Data collection level: Field	Data collection frequency: Initial enrollment

CSAF Practice Sub-questions

For certain practices, additional questions are asked that provide information necessary to estimate greenhouse gas benefits from implementation of the practice. See Table 11 in the *CSAF Practice Sub-questions* section for descriptions of individual questions to be answered depending on the CSAF practices selected.

Farm Summary

Unique IDs

Farm ID	Unique Farm ID assigned by FSA	
State or territory	State name (must match FSA farm enrollment data)	
County of residence	County name (must match FSA farm enrollment data)	

Producer TA received

Data element name: Producer TA received Reporting question: What types of technical assistance were 1-3 provided to this producer?

Description: Did the recipient or any partner provide technical assistance (TA) to the producer this year? Technical assistance is any training, education, capacity building or other support provided by any project partner(s) directly to producers enrolled in the project. List up to the top three most common types of TA provided to this producer. The worksheet provides three columns with a drop-down list of the allowed values. Choose one value for each column. If there are fewer than 3 TA types, leave unnecessary columns blank. If "other" is chosen, use the additional column to enter other TA types as free text.

CSAF Practice Sub-questions

For some CSAF practices, there is an additional set of questions that are unique to each practice. Responses to these questions are needed to verify estimated GHG benefits of these practices. If a field is implementing a CSAF practice with an NRCS CPS code in Table 11, answer the follow-up questions listed next to the relevant practice name in the table. Use the *Supplemental Reporting Workbook – CSAF Practice Sub-questions* to report the required information.

Table 11. Follow-on questions for select CSAF practices

Practice name and code	Follow-up question	Options (select one)
Alley Cropping (CPS 311)	Species category (select most common/extensive type if using more than one)	Coniferous trees Deciduous trees Shrubs
	Species density (number of trees planted per acre)	1-10,000

Partnerships for Climate-Smart Commodities Additional Specific Terms and Conditions February 2023

I. Overarching Statement

The following award terms and conditions are applicable to Partnerships for Climate-Smart Commodities agreements and are in addition to the USDA FPAC General Terms and Conditions. The award recipient must abide by all terms of this grant including, but not limited to, the General Terms and Conditions, the terms in the Funding Opportunity and associated Frequently Asked Questions, and this addendum. The recipient must also deliver on the planned objectives in the project narrative and budget narrative associated with this grant.

II. Eligibility and Highly Erodible Lands and Wetlands Compliance

In order to be eligible for an incentive payment as a part of the Partnerships for Climate-Smart Commodities, a producer must:

- Establish Farm Records with the Farm Service Agency (FSA) (have farm, tract, and field numbers in place);
- Complete an AD-2047 (Customer Data Worksheet to facilitate the collection of customer data for Business Partner Record);
- Certify highly erodible land conservation (HEL) and wetland conservation (WC) compliance via Form AD-1026, Highly Erodible Land Conservation (HELC) and Wetland Conservation (WC) Certification; and
- Certify that they are not a foreign person or entity.

Farm, tract, and field numbers are required for the producer, and ultimately the Partnerships for Climate-Smart Commodities recipient, to report climate-smart practice implementation to USDA, as well as to certify and maintain HELC/WC compliance. This will require that some producers who do not already have these numbers, like perennial crop growers or feedlots, establish these records with USDA's FSA. Farm, tract, field numbers, producer name, and Core Customer I.D. (CCID) will be provided by the recipient to the National Program Officer as a part of routine grant reporting. Recipients must ensure that producers receiving financial assistance or incentives through this project use the same name as is included in the relevant FSA Business File for that Farm ID in any contracts or similar documentation kept by the recipient.

Producers are not bound by the payment limitations and the adjusted gross income (AGI) limitations that are in place for other USDA programs.

In order to demonstrate HELC/WC compliance for Partnerships for Climate-Smart Commodities incentive payments, producers will need to request a copy of their subsidiary print from their

Partnerships for Climate-Smart Commodities Additional Specific Terms and Conditions Page 1 of 6 February 2023 USDA FSA field office. The Subsidiary Print includes print year specific eligibility related information about a selected producer. The producer will then provide this documentation to the Partnerships for Climate-Smart Commodities recipients as proof of compliance. A current year subsidiary print will be required for each crop year that the producer receives a payment, and HELC/WC eligibility information is provided under the AD-1026 and Conservation Compliance sections of subsidiary (determined by year, which can change at any time during the year or in a subsequent year). As is the case already, field offices will not be expected to provide documentation to anyone besides the producer themselves (and must always comply with Section 1619 limitations if they ever do provide documentation to third parties). Producers must have control of the land for the term of their beneficiary contract.

Recipients are responsible for determining producer eligibility within the funding opportunity requirements. Recipients must inform producers of eligibility requirements and direct them to local USDA offices for requested information as necessary, including but not limited to, farm and tract establishment and Highly Erodible Land and Wetland Compliance determinations. Privacy of producers is a priority throughout this process, and recipients are responsible for maintaining producer privacy in the process.

At minimum, the recipient will collect and review subsidiary reports from participating producers. They will ensure that the producer is listed as "compliant" in all sections of the conservation compliance portion of subsidiary and "certified" for AD-1026 before an incentive payment is made. If payments to a producer span more than one Federal fiscal year, the recipient will review an updated subsidiary print each fiscal year to ensure that the status is still compliant.

III. Other Environmental and Cultural Resources Reviews

A Finding of No Significant Impact (FONSI) was signed by USDA NRCS on August 26, 2022. A copy of the Programmatic Environmental Assessment for Partnerships for Climate-Smart Commodities is available at <u>www.usda.gov/climate-smart-commodities</u>. USDA may determine that additional environmental and cultural resources review is needed for any particular action under Partnerships for Climate-Smart Commodities. The recipient must not execute any beneficiary contracts under this grant agreement prior to receipt of a letter from USDA that specifically details:

- further procedures deemed appropriate by the Agency to ensure a completed National Environmental Policy Act (NEPA) review and all appropriate consultation requirements are met, and
- 2) additional instructions for any unanticipated discoveries or conditions.

A resolution of support is required for projects on Tribal lands from the governing body of the Tribe with jurisdiction over that land, if the applicant is not the Tribe nor an entity owned or operated by that Tribe. USDA may approve alternative documentation for resolutions when USDA deems necessary and legally sufficient.

IV. Producer Benefits

USDA encourages the recipient to disclose to participating producers the manner and amount for which any market premiums derived from the development of the relevant climate-smart commodity will be shared between participating parties, including producers. USDA will be monitoring producer benefits, in particular those to small and underserved producers, throughout the grant period. Recipients agree that their project(s) will implement a plan for engaging small and underserved producers as laid out in this agreement.

V. Producer Data Protection and Disclosure

Recipients must ensure each producer has convenient access to any data collected from that producer or the producer's land and any associated modeling as part of the project. The recipient must provide each producer applying for benefits under this grant a description in writing of how their information, including but not limited to data about their farm and commodities, will be utilized, protected and shared as applicable.

VI. Other Data and Reporting Requirements

In addition to the reporting information provided in the statement of work and General Terms and Conditions, USDA will provide a template for the Detailed Progress Report, also known as the Partnerships for Climate-Smart Commodities (PSCS) Project Reporting Workbook. Within 30 calendar days of execution of this grant, a copy of this workbook will be posted at <u>www.usda.gov/climate-smart-commodities</u> or an alternative location provided to the recipient by the National Program Officer. USDA may provide updates to the PCSC Project Reporting Workbook or submission methods to streamline the data collection process and/or reduce the burden on the recipient throughout the grant period. Generally, these updates will be provided at least 3 months in advance of any required changes. The recipient must not transfer any data to foreign governments or foreign entities without prior approval from USDA.

USDA will provide a Technical Contact for this grant. The Technical Contact will have the responsibility of technical oversight for USDA for the project. The recipient is responsible for providing the technical assistance required to successfully implement and complete the project. The recipient must comply with any requests for information from the Technical Contact. The Technical Contact for this award is the National Program Officer assigned to this grant.

Prior to execution of this grant, the recipient must provide a shapefile depicting the project boundary for enrollment under this grant. Producer enrollment may not occur outside this boundary without modification of this grant. Within 30 calendar days of execution of this grant, the recipient must provide to the National Program Officer a website address where enrollment information will be posted for producers for the project associated with this grant. Recipients will be responsible for the following reports:

- Submit quarterly performance reports that include a written progress report, as well as additional reporting on specific data elements contained in the most up-to-date version of the Partnerships for Climate-Smart Commodities Project Reporting Workbook. Additional information about each reported element is described in the Data Dictionary.
- Submit supplemental reports required to validate greenhouse gas (GHG) benefit data, including: (1) an initial project MMRV plan, (2) field-modeled GHG benefit reports, and (3) field-direct GHG measurement results, as applicable. Additional information about these reports is in included in the Data Dictionary.
- Submit copies of project outputs and deliverables (e.g., fact sheets, reports) as attachments in ezFedGrants along with quarterly performance reports.
- Report the version of COMET-Planner used to estimate GHG benefits of the project within each quarterly performance report. As COMET-Planner is updated, recipients must adopt the latest version of the tool as directed by USDA for use in performance reports.

Recipients must designate an individual as a member of the USDA Partnerships for Climate-Smart Commodities Learning Network (Partnerships Network); this representative should be identified in the Project Narrative for this grant. Each project includes a plan for up to two Partnerships Network virtual meetings and two in-person meetings a year during the project duration. Dates and other details on events will be posted at <u>www.usda.gov/climate-smartcommodities</u> or an alternative location provided to the recipient by the National Program Officer.

The Partnerships Network will be co-chaired by representative from the USDA Office of the Chief Economist and the Farm Production and Conservation Mission Area. The Partnerships Network will inform synthesis reports to be assembled by USDA on a range of topics related to the implementation of Partnerships for Climate-Smart Commodities projects, including:

- Lessons-learned as projects are implemented;
- Options for providing technical assistance;
- Procedures for measurement/quantification, monitoring, reporting, and verifying GHG benefits;
- Options for tracing climate-smart commodities through the supply chain;
- Mechanisms for reducing costs of implementation;
- A forum for discussion and learning regarding approaches to climate-smart agriculture and forestry implementation (including but not limited to deployment and

measurement/quantification, monitoring, reporting, tracking, and verification of associated greenhouse gas benefits and marketing of climate-smart commodities).

- Synthesis of outcomes; and
- Opportunities for USDA and others to inform future approaches to generating new and expanded markets for climate-smart commodities.

The Partnerships Network topics to be discussed will cover at minimum the areas described in previous FAQs and will evolve with USDA's ongoing project data analysis efforts and with input from the project recipients on the kinds of sessions that will be most helpful to them in building the diverse climate-smart markets associated with their projects. Participation may include at least one interview a year and include questions related to the following areas:

- Technical assistance approaches, methods, and successes and/or challenges
- Producer outreach approaches, methods, and successes and/or challenges
- Monitoring, measurement, reporting, and verification (MMRV) approaches, methods, and successes and/or challenges
- Marketing approaches, methods, and successes and/or challenges
- Partnership approaches, methods, and successes and/or challenges
- Data collection and storage approaches, methods, and successes and/or challenges
- Supply chain approaches, methods and successes and/or challenges, including approaches to traceability
- Supply chain benefits and demand for climate-smart commodities
- Perspectives on program design, climate-smart commodity definitions, and future approaches or opportunities
- Project successes and stories

USDA may also request producer exit reports at a later date. Additional marketing and branding-related requirements may be provided by USDA, including signage related to Partnerships for Climate-Smart Commodities.

VII. Competition and Anti-Competitive Practices

In connection with this grant, recipients may not prohibit or otherwise limit a producer from changing the provider of other services or materials not included as part of this grant. Recipients may not condition, limit, steer, or discriminate in their provision or sale of non-project business functions or products to producers based on their participation or non-participation in or use of any services provided as part of this grant. Additionally, funds in this agreement shall not be used for purposes or activities related to mergers or acquisitions.

VIII. Suspension and Disbarment

The provisions governing Suspension and Disbarment in subsection 1.a.8 shall also apply to fraud, embezzlement, theft, forgery, bribery, falsification, or destruction of records, making false statements, or violations of the Federal civil antitrust or unfair trade practice laws.

IX. Special provisions for awards to for-profit entities as recipients

This section contains provisions that apply to awards to for-profit entities. These provisions are in addition to other applicable provisions of these terms and conditions, or they make exceptions from other provisions of the terms and conditions for awards to for-profit entities. For-profit entities that receive awards have two options regarding audits:

- A financial related audit of a particular award in accordance with Generally Accepted Government Auditing Standards issued by the Comptroller General of the United States, in those cases where the for-profit entity receives awards under only one USDA program; or, if awards are received under multiple USDA programs, a financial related audit of all awards in accordance with Generally Accepted Government Auditing Standards issued by the Comptroller General of the United States; or
- 2) An audit that meets the requirements contained in 2 CFR 200 subpart F.

For-profit entities that receive annual awards totaling less than the audit requirement threshold in 2 CFR 200 subpart F are exempt from USDA audit requirements for that year, but records must be available for review by appropriate officials of Federal agencies or the Government Accountability Office.

X. Non-Disparagement

Recipients may not engage in any advertising deemed by USDA as disparaging to another agricultural commodity or competing product, or in violation of the prohibition against false and misleading advertising. Disparagement is defined as anything that depicts other commodities in a negative or unpleasant light via overt or subjective video, photography, or statements. Comparative advertising is allowable, provided the presentation of facts is truthful, objective, not misleading, and supported by a reasonable basis.
