NONDISCRIMINATION STATEMENT

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, SW., Washington, DC 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

PRIVACY ACT STATEMENT

The above statements are made in accordance with the Privacy Act of 1974 (5 U.S.C. Section 522a).

Statement of Work

Purpose

The purpose of this agreement, between the U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS) and University of Illinois Urbana-Champaign, is to build markets for climate-smart commodities and invest in America's climate-smart producers to strengthen U.S. rural and agricultural communities.

Objectives

The objectives of this project are to support the production and marketing of climate-smart commodities by providing voluntary incentives to producers and landowners, including early adopters, to implement climate-smart agricultural production practices, activities, and systems on working lands; measure/quantify, monitor and verify the carbon and greenhouse gas (GHG) benefits associated with those practices; and develop markets and promote the resulting climate-smart commodities.

Budget Narrative

The official budget summarized below and described in the attached Budget Narrative will be considered the total budget as last approved by the Federal awarding agency for this award.

Amounts included in this budget narrative are estimates. Reimbursement or advance liquidations will be based on actual expenditures, not to exceed the amount obligated.

TOTAL BUDGET \$10,846,225.00

TOTAL FEDERAL FUNDS \$4,999,999.00 PERSONNEL \$244,144.00 FRINGE BENEFITS \$82,589.00 TRAVEL \$19,016.00 EQUIPMENT \$49,664.00 SUPPLIES \$27,282.00 CONTRACTUAL \$0.00 CONSTRUCTION \$0 OTHER \$4,322,669.00 (Includes PRODUCER INCENTIVES \$1,064,000.00) TOTAL DIRECT COSTS \$4,745,364.00 INDIRECT COSTS \$254,635.00

TOTAL NON-FEDERAL FUNDS \$5,846,226.00 PERSONNEL \$0.00 FRINGE BENEFITS \$0.00 TRAVEL \$0.00 EQUIPMENT \$0.00 SUPPLIES \$0.00 CONTRACTUAL \$0.00 CONSTRUCTION \$0 OTHER \$5,846,226.00 (includes PRODUCER INCENTIVES \$0.00) TOTAL DIRECT COSTS \$5,846,226.00 INDIRECT COSTS \$0.00

Recipient has an approved Negotiated Indirect Cost Rate Agreement (NICRA) with a rate of 58.6 percent and a base of Modified Total Direct Cost (MTDC), as defined in 2 CFR Part 200, consisting of all salaries and wages, fringe benefits, materials and supplies, services, travel, and subawards up to the first \$25,000 each subaward (regardless of the period covered by the subaward); and excluding equipment (defined in Section II, paragraph G.1.), capital expenditures, charges for patient care and tuition remission, rental costs, scholarships and fellowships, participant support costs as well as the portion of each subaward in excess of \$25,000.

When equipment is purchased with Federal funds it must be used until no longer needed as described in the General Terms and Conditions and 2 CFR 200. If the residual value of the equipment is \$5,000 or more at the time it is no longer needed, the recipient must request disposition instructions. The disposition instructions may direct the recipient to: 1) sell the equipment and return a proportionate share of the proceeds to the Federal agency; 2) transfer title to another eligible entity identified by the Federal agency; or 3) keep the equipment if desired and compensate the Federal agency

for its proportionate share of the value.

Responsibilities of the Parties:

If inconsistencies arise between the language in this Statement of Work (SOW) and the General Terms and Conditions attached to the agreement, the language in this SOW takes precedence.

RECIPIENT RESPONSIBILITIES

Perform the work and produce the deliverables as outlined in this Statement of Work and attachments.

Ensure Paperwork Reduction Act (PRA) clearance is obtained prior to conducting data collection from producers or other project participants, including data collection performed by subrecipients.

Comply with the applicable version of the General Terms and Conditions.

Submit reports and payment requests to the ezFedGrants system as outlined in the applicable version of the General Terms and Conditions. Reporting frequency is as follows:

Performance Reports: Quarterly

SF425 Financial Reports: Quarterly

Detailed Progress Report: Quarterly (The detailed progress report is in addition to the performance and financial reports referenced above and described in the general terms and conditions)

Expected Accomplishments and Deliverables

See attached Benchmarks Table and associated Project Narrative.

Resources Required

See the Responsibilities of the Parties section for required resources, if applicable.

Milestones

See attached Benchmarks Table and associated Project Narrative.

GENERAL TERMS AND CONDITIONS

Please reference the below link(s) for the General Terms and Conditions pertaining to this award: https://www.fpacbc.usda.gov/about/grants-and-agreements/award-terms-and-conditions/index.html

(b)(4)

i Executive Summary

This Climate Smart Commodities proposal (second funding pool) is focused on innovations essential for accelerating market development for climate smart commodities and enabling minority farmers to participate in those markets. iCOVER (Innovative Cover-crop Opportunity, Verification and Economy stimulating technology for underserved farmers using Robotics) focuses on demonstrating the scalability of three key innovations that were co-developed with support from the USDA NIFA. These innovations (i) reduce the cost and labor burden of cover crop planting, (*ii*) enable accurate, rapid, low-cost soil carbon measurement, and (iii) ensure efficient market linkages for Climate Smart (CS) bene- for underserved farmers fits supplied by a diversity of farmers. Our team will demonstrate using Robotics

Figure iCOVER: 1: Innovative Cover-crop Opportunity, Verification and Economy stimulating technology

the scale up autonomy and sensing technologies to address three major bottlenecks in cover-crop adoption: (1) High cost and hassle of planting, (2) slow and expensive measurement of soil Carbon, and (3) low return on investment to farmers. We will unblock these critical bottlenecks through the following innovations:

- Scale up robotic cover crop planting from 1000 acres in Year 1 to 20,000 acres in Year 4, bringing the cost of cover crop planting to under \$10 per acre.
- Enable robotic high-resolution Measuring, Monitoring, Reporting, and Verification (MMRV) of soil carbon through innovative radiological robotic sensing technologies. These activities will be accomplished with Tuskegee University (**TU**), a Historically Black land-grant University (HBCU).
- Working with our partners at TU, create markets for climate-smart products for minority underserved farmers in Alabama growing specialty crops and animal products
- Working with our supply chain partners ADM, Cargill, and Nori to quantify the impact of reduced cover-crop planting costs and increased verifiability and certifiability of carbon benefits on farmers' income in the short-run and increased price premiums for the climate-smart commodities and produce in the long-run.

i.A Contact Information

Girish Chowdhary, Ph.D. (girishc@illinois.edu; (217) 300-3952); Associate Professor, Agricultural and Biological Engineering and Computer Science; Co-founder, EarthSense, Inc.; 1304 W Pennsylvania Ave, UIUC, Urbana, Illinois 61801.

i.B List of Project Partners

University of Illinois Urbana-Champaign (UIUC); Tuskegee University (HBCU); Earth-Sense, Inc. (ES); ADM; Corteva; Indigo Ag; see partner Letters of Support.

i.C List of underserved/minority-focused project partners

Our primary underserved/minority-focused project partner is Tuskegee University (TU), a historically black land-grant university (HBCU) based in Tuskegee, Alabama.

i.D Compelling need for the project

Market-based mechanisms for helping farmers adopt Climate Smart practices are currently bottlnecked by the expense and complexity of adopting Climate Smart practices, as well as quantifying their on- and off-farm beneficial impacts.

The proposed project focuses on cover cropping, a very well-studied climate-smart practice that can sequester carbon, increase on-farm productivity, and significantly improve farms' resilience to increasingly intense and frequent extreme weather like droughts and heat waves, intense rainfalls, and unseasonal frosts. Cover crops species and mixes can be optimized to provide substantial benefits for farms and soils, including increasing soil nitrogen content and plant nutrient availability, reversing soil compaction, increasing the soils' water infiltration rate and moisture-holding capacity, as well as increase the diversity, abundance, and activity of plant-beneficial soil microbiomes. Finally there is significant evidence that well-designed cover cropping practice can even improve insect control and pollination by providing habitats for beneficial insects.

Yet, despite these well-characterized benefits, cover crop adoption remains low– under 5%–in the US. This is primarily because farmers find the cost and hassle of cover crop planting high, the return on investment low and slow to manifest, and the short-term yield penalty unaffordable. Last but not least, because reliably quantifying soil carbon accumulation and other regenerative benefits from cover crops are highly labor-intensive and expensive, delivering meaningful direct market payments for the social benefits of these practices has so far proved impractical.

Current methods of cover-crop planting have several limitations. Aerial broadcasting is expensive, and requires up to double the seeding rate; planting with modified highclearance sprayers damages the cash crop - often reducing yield 2-5%, and post-harvest seeding with drills results in reduced germination and poor winter survival, especially in Northern latitudes. Finally, per acre cost of cover crop planting currently ranges from \$15 - \$25, which is a significant barrier to entry, especially for minority farmers. Hence there is a need for an alternative, low-cost, low-hassle method for cover crop planting.

Similarly, existing MMRV approaches produce low-quality, high-error outputs, resulting in depressed market prices for Climate Smart commodities relative to other climaterelated economic instruments. The primary hurdle is that it is expensive, time-consuming, and labor-intensive to verify the quantity of the carbon sequestered in soils accurately. Most current MMRV methods rely on sparse on-ground measurements and mostly on models that use satellite/aerial data-despite this approach having limited sensing quality and large errors in the models-based prediction of benefits. As a result, the market for Climate Smart Commodities has remained stagnant despite its strong potential. Therefore, there is a need for high-resolution, low-cost, and high-throughput MMRV method.

Together, these bottlenecks have kept cover crop adoption to less than 5% of farmland in the US - or fewer than 20 million acres out of the 400 million acres of arable crop-land.

i.E Approach to minimize transaction costs associated with Climate Smart Commodities during and after the proposed project:

Bringing transaction costs significantly below the *status quo* through robotic automation is a core priority of our approach to scaling cover crop adoption. We will enable digital data generation from end-to-end - i.e. from planting, emergence monitoring, termination,

soil carbon measurement, and market linkages. This data and models will be made available to farmers and commodities supply chain partners *via* established, easy-to-integrate Application Programming Interfaces (APIs). This will enable reduction of the overhead and transaction costs currently integral to with Climate Smart Commodities practices.

ES has strong experience in bringing down transaction costs in relevant domain, including bringing down cost of phenotyping by 10X and increasing valuable data output by 100X by scaling-up field robotic technology. ES has commercialized a field robot that provides seamless delivery of digital phenotypes from agricultural fields (Section i.H) to users' desks in an automated manner. ES phenotyping robots TerraSentia are being used to reduce phenotyping costs through robotics by commercial customers across the agricultural value chain with over 100 robots deployed in the US, Europe, and Asia.

ES has already started building the secure digital data pipeline for Climate Smart Commodities, starting with on-boarding farmers for cover crop planting. Since March 2021 farmers have signed up 26,135 acres for cover crop planting with ES robots, with an average of 706 acres per farmer, using ES digital platform. During the course of the project, ES will provide matching in the form of software engineering and data management services, in order to enhance the software and APIs for handling cover crop management, MMRV, and market linkages. This will eliminate the overheads and transaction costs from the project, while simultaneously creating a very strong incentive to keep transaction costs as low as possible after the conclusion of the proposed project.

Software-enabled data security will further reduce overheads costs, while improving trustworthiness of the Climate Smart benefits of these commodities. Double-counting is currently a critical bottleneck and perceived trustworthiness issue choking the markets for Climate Smart Commodities. Ensuring protection against double-counting currently creates significant transaction costs and overheads, further reducing the portion of the market-based incentives that reaches farmers. Our digital data pipeline will use distributed ledger technologies (commonly known as "blockchain"), automated, verifiable, software-based data management, and protocols to guard against double counting. It is important to note that we will use low-compute "proof-of-stake" blockchain protocols which reduces the energy cost of distributed ledgers by 99%, without reducing data security. These software innovations will enable high levels of trust in Climate Smart Commodities.

The effect of reduced costs and increased trustworthiness of our digital platform will unlock the markets for Climate Smart Commodities by increasing market participation and liquidity, and dramatic reduction in the transaction costs for these commodities.

i.F Approach to reduce producer barriers: Robotics for Cover Cropping

We propose scaling up of innovative robotic technologies designed to remove the barriers to entry for cover cropping. High cost of planting, quantification, and verification are key barriers to entry that are keeping cover crop adoption low (see Section i.D). In addition, for minority and small-holder farmers, the high cost of planting and quantification, and limited access to markets for price premiums further hampers participation. This Phase 2 project will address these barriers through the following *key innovations*:

Innovation 1 (I1) Robotic cover crop planting to lower the cost of planting: We will scale up our innovative under-canopy robotic to bring the cost of cover crop planting to under \$10 at 10,000 acres scale.

I2: High-resolution robotic sensing for quantification of under-ground Carbon: We will quantify high resolution underground soil carbon using inelastic neutron scattering sensors on robots.

i.G Geographic Focus

We will focus on two geographies. First, the MidWest region, and particularly Illinois, Indiana, Iowa, and Missouri. Here we seek to scale up robotic cover crop planting and measurements to 20,000 acres by year 4. The complete cost of cover crop planting will be borne through this project - the first three year with USDA funds, and in year 4 with market funds, so that farmers get to try robotic cover cropping for free and without hassle. We will work with supply chain partners, in particularly with ADM to drive market creation for climate-smart corn (see ADM letter). ADM is already seeing significant potential demand for climate smart commodities, including corn, from downstream customers, from which this project will benefit. To mitigate the risk of delayed market demand, we will also work with vendors who are directly selling carbon offset credits to farmers. Here we leverage our strong relationships with Corteva, Nori, and IndigoAg (see letters) to make carbon offset credits directly available to farmers.

Our second region of focus is the Alabama region, with specific focus on farmers near Tuskegee University. In this region by year 4 we will work with around 1000 acres of minority and small-holder farmers to engage them with cover cropping, and to accelerate market creation for climate smart commodities and produce. This will be enabled through the thriving extension program at Tuskegee led by Prof. Raymon Shange. The validation of our MMRV activities will be accomplished mainly at Tuskegee (HBCU) University.

i.H Project management capacity of partners

The project will be managed by UIUC's Institute for Sustainability, Energy, and Environment (iSEE) and Tuskegee (HBCU), which have the administrative capacity, infrastructure, and experience to manage large, federally-funded projects with industry partners, as demonstrated with a DOE-funded Bioenergy Research Center (\$115M), ARPA-E-funded SmartFarmPrograms (\$10M), USDA-funded SCAPES (\$10M), and USDA funded Farm of the Future (\$3.9M). ES is an agricultural robotics and AI startup commercializing autonomy and machine-learning technologies originally created at UIUC with 27 employees and 5M+ in funding and revenues. ADM is one of the world's largest nutrition companies (400,000 members) and has a strong track-record of innovation through partnerships and identification of consumer trends, and in supporting the growth of American economy by reducing barriers in trade, and through their investment in infrastructure and sustainability. Corteva is a leading (16k granted patents in 140 countries) agricultural, chemical, and seed company, specializing in manufacturing of numerous award winning sustainable products. Indigo Ag concentrates on the sustainable Ag market using natural microbiology and digital technologies, working farmer-owned cooperatives and individuals since 2013.

H.1 UIUC and TU collaboration: UIUC has a strong history of leadership in advancing sustainability. UIUC is also home to the USDA/NIFA Farm of the Future site (*Illinois Farming and Regenerative Management (I-FARM) testbed*) in partnership with TU of which PI Chowdhary is the director. One key focus on the I-FARM testbed is to mature and deploy in commercial scale robotic cover crop planting. Both ES and Corteva are strategic partners on I-FARM. The iCOVER project will significantly benefit from I-FARM - a testbed for

our robotic planting and MMRV technologies before deploying them on farmers' fields. Furthermore, I-FARM includes a significant extension component focused on education and outreach with farmers in regenerative management with robots. These activities will be leveraged by iCOVER for farmer outreach, education, and recruitment.

H.2 EarthSense, Inc.: The founding mission at ES is to enable farmers to make more money while helping reverse climate change and make the food system climate resilient.

Climate Smart Focus: In addition to the TerraSentia system being used widely to help design the next generation productive, resource efficient, and climate resilient crops, in 2020, ES started building on the autonomy capabilities of the TerraSentia system to develop the TerraPreta cover-crop planting robot (Figure 2). During the 2022 season, ES is deploying 10 TerraPreta robots around the mid-west and mid-south region to inter-seed cover crops in over 1000 acres of commodity crops. Finally, ES has used in-house prototyping capabilities to build a prototype of the TerraMax robot that will be deployed to carry and power the radiometric soil carbon measurement device that'll be tested as part of this project.

Resources: ES has earned more than \$1 Million from commercializing their TerraSentia field phenotyping system. TerraSentia robots have been deployed with a variety of customers, including scientists at the USDA-ARS, crop-science faculty at the leading Universities (Cornell, Iowa State, Texas A&M, North Carolina State, North Dakota State, and more), and crop breeders at private sector global crop-genetics companies. In addition to revenues, ES has raised \$3.5 Million in private funding and received federal support in the form of SBIR and STTR grants from the NSF totaling \$1.3 Million. ES has a well-established supplier network, with components sourced from components manufacturers in the US and overseas, with final assembly and software installation being done at EarthSense.

Our team has unique strengths in under-canopy robotics : PI Chowdhary (UIUC) is a leading expert in agricultural robotics. Co-I Atallah (UIUC) has made key contributions to understanding economic barriers for adoption of robotic technologies. Co-I's Quansah (TU) and Di Fulvio (UIUC) are experts in remote sensing and radiological sciences respectively, and Co-I Shange (TU) is the director of a thriving extension program with minorities and small-holder farms in Alabama.

The execution of cover crop planting will be done by ES under the able leadership of Co-I Soman, the CEO of EarthSense. Dr. Soman was a NSF Postdoctoral Sustainability fellow and an expert in soil health and regeneration. ES is the leading provider of undercanopy robotics in the world, we describe below two key robotic products by ES that will be relevant in iCOVER.

Under-canopy phenotyping: The *TerraSentia* robotic system is a compact robot designed particularly for high-throughput field phenotyping . Each TerraSentia features fully independent all-wheel drive with environmentally sealed brushless DC motors, powerful onboard compute, 2 LiDAR sensors, 4 cameras, and a RTK GNSS receiver. Together these robots have scanned well over 100,000 commercial breeding plots - delivering high-throughput phenotyping data on multiple plant traits simultaneously, notably stand count, plant height, corn ear height, and soybean pod count for major ag-tech firms.

Under-canopy Cover Crops Inter-seeding: In 2021 Chowdhary and Lee started evaluating EarthSense's *TerraPreta* under-canopy cover-crop planting robot as a part of the NIFA funded AIFARMS project at UIUC. TerrePreta features a wider body and a metal chassis that supports 120 lb of cover-crop seed payload. In 2021, EarthSense deployed 6 TerraPreta

robots to plant over 100 acres of cover-crop from July through October. The resultant cover crop growth strongly support the feasibility and performance of under-canopy cover crop interseeding with the autonomous TerraPreta robots.

Figure 2: (a) 2021 TerraPreta, (b) planting in corn, (c) 2022 updated TerraPreta with improved robustness and designed for better performance at lower hardware cost by removing the Lidar

ii Plan to Pilot Climate-Smart Agricultural Practices at Large Scale

This project is focused on scaling up of robotic cover crop planting and quantification methods to a reasonable scale of 20,000 acres. The target scale of 20,000 acres is carefully chosen to fit the available budget for Phase 2 projects, and to provide sufficient breathing room to mitigate technical risk as innovative robotic methods are scaled up. In addition to this USDA funding, our partners at ES will have additional resources to scale up cover-crop planting, and the actual achieved scale enabled by this funding may be significantly larger.

ii.A Description of CSAF practices to be deployed: Cover Crops

The CSAF practice to be deployed in this project is cover crops, preferably by interseeding them in season while the main cash crop is also in the field. Cover crops will be planted during the growing season by robotic planters, with the goal of reducing cost and hassle of cover crop planting (see Section i.D). As discussed in Section i.G, the two primary focus geographies are the US Midwest and Alabama. In the Midwest, our focus cash crop is corn (zea mays), in Alabama we will work with small farms which typically tend to have more diverse vegetable crops and integration of animals.

In addition to the cover-crop planting, we expect that bringing down the cost of seeds (due to reduced seeding rate required from inter-seeding, and economies of scale from sourcing directly from seed companies) as well as cover crop termination (with existing GPS-guided tractors) will enable the total cost of cover-crop management will be reduced from a typical \$40 - \$70 per acre, to \$20 - \$35 per acre.

ii.B Plan to recruit producers and land owners

This project focuses on scaling innovative cover crop planting and MMRV technologies from 1000 acres in the first year to 10,000 acres in the third in the US Midwest corn-soybean rotations. In year 4, we expect to plant and monitor at least 20,000 acres, funded fully by Climate Smart Commodities market payments. In addition, we will scale up cover crop planting on small and minority farms starting with 100 acres in Alabama scaling to 1000 acres in the third and fourth year. The scale-up plan is carefully chosen to mitigate the risk of high-cost of deployment of relatively smaller scale and novel robotic products, while maximally accelerating deployment as costs are reduced through technical development as well as economies of scale.

EarthSense, Inc. already has over 25,000 acres of independent farmers signed up for robotic cover crop planting. In addition, the project team will have access to many hundreds of thousands acres through our partners like Corteva, Indigo Ag, ADM, and more. Farmers and land owners in will be recruited through the following primary means:

- EarthSense: ES has an active farmer recruitment system through their website (www.earthsense.co). Farmers can easily sign up for cover crop planting through the website directly, indicating the location of their fields and preferred dates for planting. At the back-end, a database is maintained, and is utilized to optimize deployment in order to minimize costs. ES already has **26,135 acres** recruited through this system, of which over 1000 acres are being planted in 2022 with the TerraPreta robot.
- External partners: Corteva and ADM have strong relationships with a huge number of farmers and land owners who are trying cover crops with their respective programs, and acres where conventional MMRV systems are already in place. They are also committed to working with minority farmers and land owners, and have active programs in place for this. We will work with them to recruit farmers.
- Illinois Extension: The IDEAS farmer group, and several other farmers already work with Illinois in trying out innovative technologies for sustainable agriculture through the Illinois Institute of Sustainability Energy and Environment (iSEE). iSEE will provide us with the necessary administrative support to recruit these farmers.
- TU Extension for recruiting minority farmers: Co-I Shange has an active extension
 program with minority small-holder farmers in Alabama where cover crop activities are currently being pursued. This project will provide the necessary financial
 assistance to recruit minority farmers. In addition, Shange's team will lead market
 creation activities in collaboration with Co-I Shadi, who is an agricultural economist.

ii.C Plan to provide technical assistance, outreach, and training

We expect that our innovative robotic planting service will not put any technical load on farmers for cover crop planting or MMRV. The primary ways of providing technical assistance to farmers will be through robot operators who go out to the field to plant cover crops. Cover crops will be planted as a service to the farmers, they sign up for acres, a suitable date is agreed upon, and a team of 5 robots with 2 operators in year 1, and 1 operator in year 2 show up on the farm and get the field planted. Farmers are welcome to see the robots in action and learn how to operate them. These robots are designed to be easy to operate and are at Level 3 autonomy (one operator can command multiple robots). Similarly, MMRV will be provided as a service to farmers, and its cost is already

included. Our team will visit the farm with the necessary MMRV equipment, which could be manual ground corers and manual biomass measurement tools, as well as our plant sensing robot TerraSentia, and the under-ground Carbon sensing robot TerraMax (Fig. 4).

An online farmer dashboard will be maintained by EarthSense, where farmers can log in to see pertinent information, including invoices, planting dates and progress, MMRV results, and market connections. We will also leverage the systems that our project partners Corteva and ADM have in place.

Our Market Research Scientist will assist farmers who choose to participate in the 'Carbon by Indigo' program or in Nori's carbon removal program in submitting the required information to the respective platforms. Our relatively small number of farmers will make that possible. Similarly, our Market Research Scientist will provide individualized assistance to farmers who choose to enroll in the 'Market+ by Indigo' program to alleviate the knowledge and procedural burden of the bidding and contracting process.

Farmer Outreach: In addition, we will hold outreach days leveraging UIUC and TU Extension networks. The I-FARM testbed already has extensive extension activities to educate and train farmers about robotic cover-crop planting and mechanical weeding technologies. We will synergize farmer outreach days with these existing efforts. Finally, we can reach and educate many farmers through the vast network of suppliers to our project partner, ADM.

ii.D Plan to provide financial assistance for producers/land owners

Participating farmers and landowners will be compensated for their efforts through the following primary means:

iCOVER will pay all costs associated with cover crop planting and MMRV: As described in the budget, ES will perform cover crop planting as a service to farmers and landowners. ES portion of the budget will bear all costs of cover crop planting, including the bill of material and labor cost for building the robots, batteries for robots, cover crop seeds, renting and fuel of trucks to transport the robots, wages of robot operators, warehouse costs, and cost of support staff that will provide robot maintenance and logistics support. iCOVER will provide financial assistance to farmers to offset other costs: To account for potential short term yield drop, cover crop termination costs as applicable, and to provide an incentive to participate while markets for climate smart commodities are underdeveloped, the ES portion of the budget will also include a 10% payment for income the farmers have historically generated for each acre. The per acre income based model is adopted to ensure fair treatment of minority farmers who do not have many acres, so a flat per acre price would not be sufficient. For Midwestern farmers growing corn, the payment price will be determined by multiplying current price per bushel by bushels harvested from acres where cover crops are to be planted averaged over last 3 years. For minority farmers, the price will be determined by averaging last three years of per acre income. Out of this payment, farmers will pay a \$10 per acre cover-crop planting fee, in order to ensure a reasonable anchoring point for future cover crop planting and management fees.

ii.E Plan to enroll underserved and small producers

Tuskegee University (TU) has a historic relationship to small and minority producers in the Black Belt region of Alabama. From the consistent outreach work of late Dr. George Washington Carver to producers in the Black Belt on maintaining soil health while increasing yield, to the establishment of the country's first Cooperative Extension program, TU has a long history of assisting minority producers. Today, that relationship has evolved with time, but remains central to the success of small and minority producers in the state and region. TU Cooperative Extension and the Carver Integrative Sustainability Center led by Co-PI Shange have 20+ staff that work and live in the 20 counties of Alabama that we consistently work in. They consistently monitor and assist operations through field visits, one on one conversations, and digital communications. These staff will utilize their network of farmers and ranchers to enroll underserved producers in iCOVER. We will have Extension faculty specialists who will hold recruitment and informational sessions for iCOVER further outreach and enrollment.

ii.F Details of Innovation 1 (I1): Scaling up cover crop robots

Our team will utilize this USDA funding to accelerate scaling up of our robotic covercrop planting to bring down the cost of cover crop planting by half or more, and increasing income to farmers from cover-crop by up to 5X. In short, at scale our robotic planting service will be cheaper and better for the farmer! It will also be scale neutral, enabling minority and small-holder farmers to adopt climate-smart practices. We expect this to help accelerate market formation for climate-smart commodities.

TerraPreta Robotic Cover-Crop planters: EarthSense - UIUC team has developed the TerraPreta robotic planter which plants cover crops. The key innovation in these autonomous robots is that they operate from *under the crop canopy*, this enables the robots to plant all the way from July, giving cover crops an excellent 3 month head-start, and at much cheaper per acre prices. Our goal in this project is to bring down the cost of planting to under \$10 per acre. To elaborate, under canopy planting involves a team of robots driving through the rows of planted crop broadcasting cover crop seeds close to the ground. A team of 5 robots driving at 3 miles per hour can cover 80 acres in under 5 hours. This is enabled because the spread of the seeds is over 3 rows of crop (the row the robot is in, and half the row on left and right of the robot). Furthermore, unlike aerial broadcast, which results in many seeds being stuck on leaves of the plant, the seed to ground contact is exceptionally high with our under canopy planting method. In addition, because the robots drive at 3 miles an hour as a team, the seed spread is more uniform compared to tall tractor based planting where the equipment has to drive at 8 miles per hour to cover the field in reasonable time.

Each robot carries 120 lbs or more of cover crop seeds. We have successfully planted a variety of seeds, including rye, hairy vetch, turnips, clover, and many more. The hopper bin contains these seeds and also has an auger which drives the seed to the specially designed broadcasting spinner. The spinner blades and the chute that drops the seeds on the spinner are specifically designed (patent pending) to minimize high bounce, and ensure equal spread to the left and the right. The seed volume is sufficient for a round trip on a quarter mile farm. When the robots are back, they can be filled again with seeds, either manually or with an automated seed refiller (patent pending).

Another key innovation in these robots is their autonomy. The robots use 5 onboard cameras to determine the distance to the row and the angle to the row, akin to [1]. This relative navigation is critical be-

Figure 3: Cover crop planting from 1000 acres in Year 1 to 20,000 acres in Year 4, bringing the cost of cover crop planting to under \$10 per acre

cause planting field maps using GPS are unreliable under the plant canopy as GPS signals experience errors and get attenuated due to the moisture in the plants [2]. In addition, the robots communicate with a tablet-based app using LoRA and Wi-Fi, thus enabling a single operator to monitor and command multiple robots

These robots planted 100 acres of cover crop in 2021, scaling up from 5 acres in 2020. They are on track to plant 1000 acres in 2022. Figure 3 shows the acres that will be planted

each year and bringing the cost of cover crop planting to less than \$10 per acre by year 4. ES has borne the cost of maturing the technology, and as a part of this project, the ongoing cost of technology development over the 4 years of this project will be provided as a match to iCOVER. This substantial match is estimated to be over 5 million dollars. The cost of maturing the technology has been borne by EarthSense, and as a part of this project, the ongoing cost of technology development over the 4 years of this project will be provided as match to iCOVER. This substantial match is estimated to be over 5 million dollars. The cost of maturing the technology development over the 4 years of this project will be provided as match to iCOVER. This substantial match is estimated to be over 5 million dollars.

iii Measurement, Quantification, Reporting and Verification Plan

Tuskegee University (TU) will focus on MMRV activities. In the first 3 years of the project, TU will use the standard and well established soil sampling and remote sensing methods to measure and quantify the effect of cover crops on carbon sequestration in the farmer lands. However, these methods are time consuming and doesn't have higher resolution. This data will also be used to develop models for the innovative measurement techniques proposed in section iii.F below that can be easily scaled to more acres. We will deploy the innovative method on the 10000 acres in the final year of the project.

iii.A Approach to greenhouse gas benefit quantification

Cover crops are known to help sequester carbon and minimize adverse impacts of climate change. Different cover crops are likely to sequester carbon at different rates. Knowing the impact of different cover crops in carbon sequestration is critical in the global efforts at reducing climate change from agricultural practices.

Remote sensing (RS) provides an efficient means for monitoring and mapping of soil properties, including soil organic carbon (SOC), soil moisture, soil textures, organic, macroand micro-nutrients, cation exchange capacity, electrical conductivity, pH, and iron [3]. Different RS systems, including multispectral [4], hyperspectral [5], LiDAR and RADAR systems can be used in developing indices and products to measure different biophysical properties of vegetation and soils. Specifically, the visible, shortwave-infrared (SWIR) or near-infrared (NIR) wavelengths are important in quantifying SOC trends and other soil properties. To effectively classify and validate soil property trends from remote sensing, field data of measured soil variables are needed.

Soil Sampling: SOC and different soil organic pools, such as light and heavy fractions, across the study sites/fields will be assessed making use of Fourier Transform Infrared Analysis (FTIR), and GPS coordinates for each sample site will be taken using a Trimble Geo 7X handheld GPS. Surface residue and soil will be sampled, using a Gidding rig or simple hydraulic probe equipment, following standard protocol for soil sampling.

Tuskegee University will use remote sensing and infield soil sampling and testing to assess cover crops green biomass and their impact on soil organic carbon additions.

iii.B Approach to monitoring of practice implementation

Baseline measurements will be taken for each sample site just before the planting of cover crops. Additional measurements will be done at the end of each growing season on yearly basis. A number of representative locations within research fields of interest will be located and up to five sampling points around this location will be sampled and composited to obtain one sample per field. The intent will be to maximize the number of fields with unique management style, cover crop types, and geographic location. Surface

residue within a 30-cm diameter ring will be collected at one location in each field to characterize ground cover and to analyze for carbon and nitrogen contents. 10-20 core samples up to 30 cm depth will be randomly taken from each sampling site seasonally in each year of the study period. Each sample will be separated into depths of 0-5, 5-10, 10-15, 15-20, 20-25, and 25-30 cm. Samples will be oven-dried and then ground in Braun Pulverizer Type UA-53 (Braun Corp. Los Angeles, USA). Fifty grams of each oven-dried and milled sample will be weighed and SOC and different soil organic pools determined following procedures as done by [6]. Furthermore, same soils will be tested at the Auburn Soil Testing Lab for percent SOC among the depths to know how much carbon had been sequestered over the study period making use of assessment of organic matter additions.

iii.C Approach to reporting and tracking of greenhouse gas benefits

RS analysis will be used to develop related cover crop biomass, soil indices, and other biophysical products. The RS outputs will be used in collaboration with the field sampling results to develop spatial trends in SOC and soil carbon stock, and for further analysis including the enhancement of the DayCent model and the COMET tools utilized by the USDA. This remote sensing analysis will be further complemented by the high-resolution robotic soil carbon measurement using innovative measurement techniques (Section iii.F).

iii.D Approach to verification of greenhouse gas benefits

Greenhouse gas benefits will be measured by estimating sequestered carbon using the COMET tool as described above. This will be further complemented by the innovative high-resolution robot based soil carbon sensing method described in Section iii.F.

iii.E Agreement to participate in the Partnerships Network

The leadership team including Girish Chowdhary, Chinmay Soman, Joseph Quansah, Faiza Aziz, Naveen Uppalapati, Angela Di Fulvio, and Greg Webb, will be representing iCOVER to join the "USDA Partnerships for Climate-smart Commodities Learning Network". The team agreed to participate in sharing knowledge, and experiences during partnership network activities, in order to generate synthesis reports.

iii.F Further details on I2: Innovative methods for high-resolution proximal sensing

We propose to develop and scale-up an innovative in-situ robotic system capable of soil carbon measurements at high-throughput by employing contact-free radiological method for fast, accurate and automated SOC quantification. We will deliver a Robot-Enabled CArbon Radiological (RECAR) measurement system on a robot capable of quantifying in-soil carbon content with 1% wt ¹²C resolution in less than 10 minutes. This is a non-invasive, in-situ method for the quantification of SOC without the requirement of sample collection, preparation and transportation. The main innovation of the proposed method is the simultaneous use of gamma-ray and neutron signatures from neutron interaction with the carbon in the soil to retrieve its absolute content in the inspected volume. Methodological innovations also include the use of high-resolution and spectroscopy-capable detectors that will increase the measurement signal to noise ratio (SNR) and the use of statistical algorithms that have been developed, and will be further matured in conjunction with Tuskegee for the analysis of radiation data in the presence of weak signals. Our carbon sensing approach relies on highly penetrating neutrons and unique gamma-ray and neutron signatures produced by

carbon upon neutron interaction. Therefore, the proposed method can measure the carbon content in depth (down to 2 m) and is highly sensitive and specific to carbon content.

Figure 4: TerraMax RECAR (Robot-Enabled CArbon Radiological) Measurement System

Our in-situ robot based method has significant benefits over all existing methods. Existing remote sensing techniques employ data collection platforms like satellites, aircrafts and Unmanned Aerial Vehicles (UAVs) equipped with multi- and hyper-spectral sensors[7, 8]. The exsitu methods, on the other hand, mainly comprise of laboratory-based analytical techniques like dry combustion, loss on ignition test, active carbon tests etc. Other reported ex-situ methods include Laser Induced Breakdown Spectroscopy (LIBS) and Soil Condition ANalysis SyStem (SCANS)[9, 10]. To date, only a few insitu proximal sensing techniques are proposed;

shank-based VIS-NIR unit, soil penetrometer, and Gamma-ray spectroscopy induced by INS (Inelastic Neutron Scattering) [11–18]. A comparison of the features of these methods with our proposed method may be seen in Table 1.

Method	High Throughput	High Resolution	Non- Invasive	Measurement with vegetative cover/without soil pretreatment	Scale Neutral	Measurement down to 2 metres Soil Depth
Remote Sensing (Satellites, UAVs etc)	x	x	~	x	x	x
Lab-based Analytical Techniques	x	\sim	x	x	×	×
LIBS [9]	×	~	×	x	×	x
SCANS [10]	×	~	×	~	×	×
Shank-based VisNIR Unit [12]	\sim	×	1	×	×	x
Penetrometer [11]	×	1	×	~	×	x
Gamma Spectroscopy by INS [17]	~	~	1	7	1	×
Our Method (RECAR)	1	~	1	1	1	~

Table 1: Comparison of Features for Soil Organic Carbon Measurement Methods

Our RECAR measurement system comprising of a portable neutron generator, detectors, high-capacity battery and other electronics will be mounted on EarthSense TerraMax robot (Fig. 4). TerraMax has a design payload capacity of 2000 lbs which is suitable to house the 85 lbs payload of the RECAR system along with any shielding requirements. TerraMax has a drive speed of 5 MPH which will be modulated according to the needed measurement depth and accuracy. The developed system will measure SOC in real time and will be sensitive enough to gauge the impact of cover crops over large soil volumes. Figure 5 shows the principle of operation and the creation and detection of the gamma ray and neutron signatures. Our method uses the neutron-induced gamma-ray and scattered neutrons for SOC estimation. These two signatures are processed separately and ultimately fused to increase measurement accuracy and reduce inspection time. The neutron generator produces a pulsed high energy neutron signal which can penetrate the soil and interact with soil nuclei. Upon inelastic scattering with the soil nuclei, characteristic gamma rays are emitted. These gamma rays serve as a fingerprint of the interacting element and allow determining its concentration in the soil. The ${}^{12}C(n,n'){}^{12}C$ scattering reaction produces the prompt emission of 4.44 MeV gamma rays from the first carbon excited level, which is the first signature to be used for SOC quantification.

Figure 6 shows a simulated neutron interrogation of a soil sample, the 4.44 MeV gamma ray emitted by inelastic scattering on carbon measured using a High-Purity Germanium (HPGe) detector and a pulsed neutron generator.

We conducted MCNP (Monte Carlo N-Particle) simulations using a 1E8 n/s emitting generator and using only the gamma-ray signature. The simulations shows carbon content in the inspected soil volume can be quantified with a measurement resolution of 5% wt and an accuracy of 1% in less than 10 minutes.

For gamma ray detection, we plan to use LaBr3 scintillators or HPGe semiconductor detectors. This will allow better peak identification and improved SNR compared to traditionally used NaI(Tl) [18]. It will also reduce the uncertainty associated with the carbon content estimate, hence, increasing the overall measurement sensitivity. Should HPGe detector be

Figure 5: Radiological interrogation technique: Fast neutron-induced inelastic gamma rays generated in soil and detected with the gamma-ray sensitive detector. Scattered neutrons are detected by a spectroscopy-capable neutron detector.

Scaling up high-resolution robotic sensing for cover crop quantification: In the first year of this project, we will perform radiation transport Monte-Carlo simulations using the stateof-the-art MCNP code to optimize the detector volume and configuration, e.g., collimating structure, to maximize the SNR hence minimizing the measurement time. The second year will be devoted to the design and development of the measurement system, using DT neutron generator and state-of-the-art radiation detectors and acquisition electronics already present in the Co-PI's lab. Carbon quantification obtained with the RECAR system will be extensively validated using gold-standard measurement techniques, e.g., soil Dry Combustion. This validation conducted by co-PI at Tugskee University will allow to optimize the data collection and analysis strategies to correct for any measurement bias that the system may exhibit. During years 3 and 4, the RECAR will be coupled to the robot and its full automation will be implemented. In-field testing will be conducted and the system will be ruggedized to enable its operation in harsh environmental conditions.

Using the neutron generator for this assay will not increase the radiation dose to workers compared to the exposure to the natural radioactive background (6.2mSv/year). Therefore, we will implement safety measurements, namely, adding neutron shielding and incorporating an interlock system that will only allow the generator to be energized at a distance of at least 20 ft from the operator and the measurement location.

iv Plan to Develop and Expand Markets for Climate-Smart Commodities

iv.A Partnerships designed to market climate-smart commodities

We will use EarthSense's dashboard to recruit farmers interested to participate in iCOVER. We will leverage our partnerships with Indigo and Nori (see letters) to help farmers realize the added value of the climate-smart (CS) attribute of their grains through one of two ways. Farmers have diverse preferences regarding selling carbon credits to corporations vs. selling their grains at a CS premium. For that reason, we will give farmers who enroll acres for robotic cover cropping with ES the option to sell carbon credits through the 'Carbon by Indigo' program or Nori's carbon removal program, sell their CS grains to 'Market+ by Indigo', or not participate in any CS added value program.

Farmers who choose to participate in Indigo's or Nori's program will receive payments from these companies for the credits produced. The programs have different requirements for farmers, such as submitting field and management information, which are typically an added burden to entry to the program. Our Market Research Scientist will provide technical assistance to farmers where needed to alleviate that burden and our relatively small number of farmers will make that possible. Nori has agreed to assist iCOVER in paying particular attention to minority and smallholder grain and specialty crops farmers to create a market for their CS produce and grains (see Nori's letter).

Farmers enroll in the Market+ by Indigo program will be matched with grain buyers interested in buying CS grains at a premium. If the farmer and the buyer agree on a price premium, they will digitally manage and sign the contract and get paid according to its terms. Our Market Research Scientist will provide individualized assistance to farmers when needed to alleviate the procedural burden of the bidding and contracting process.

In year 4, planting costs are not charged to the grant, and we will use market resources to cover the expenses to plant 20k acres of commodity and 2k acres of minority farms. **Market building for underserved producers:** The Black Belt Marketing and Innovation Center in Selma, AL serves as both an educational and training facility for small and minority producers and a processing, cold storage, and logistics unit for produce. The

facility has acted as a food hub in multiple marketing projects for small producers and markets such as Walmart, Whole Foods, schools, and restaurants. The plan is to market the products that come through the center as Climate-Smart commodities and specialty crops with the entities named earlier and through newly established partnerships through iCOVER with other grocery chains and restaurants. One of the strategies in the past has been to invite market representatives to the workshops and conferences to allow producer-buyer discussions, allowing for more producer control.

iv.B Post-project potential

We will conduct three analyses to assess the potential of CS premiums beyond this project. First, we will statistically predict enrollment and premiums accepted by farmers

beyond our sample. We will collect survey data from farmers who sign up for robotic cover cropping and those who sign up for a carbon credit or price premium contract. This data will include their CS premiums (Section iv. A), the characteristics of their farm, and their socio-demographics. We will analyze the systematic differences between the farmers who participated and those who did not participate in a credit or premium program. We will also examine the determinants of the willingness to accept as a function of these characteristics. These models will allow us to predict the future supply of CS grain and at what premium rates for the general population of farmers in the Midwest and Alabama. Second, we propose to use our Extension network at Tuskegee and the The Black Belt Marketing and Innovation Center in Selma, AL to engage restaurant buyers in the area and determine their demand and willingness to pay price premiums to purchase CS commodities and specialty crops. Since the number of restaurant chefs that we can possibly recruit will be small for a representative statistical analysis, we will assess their demand and willingness to pay a CS premium using a systematic qualitative method called the Delphi method to obtain consensus on the willingness of restaurant chefs to purchase CS commodities and specialty crops [24]. We have experience working with panels of experts and experience conducting consumer willingness to pay in the context of specialty crops such as herbs and hops produced by small farmers [25, 26].

Third, we will conduct a nationally representative online retail consumer survey to estimate consumers' willingness to pay for food items made with CS ingredients and grown by HU (historically underserved) farmers. We will focus on a major food item that has corn as a major ingredient, such as breakfast cereals (other items of interest include cotton (e.g. clothes) and peanuts (e.g. peanut butter), grown by Alabama farmers). Because there are currently not many products on the market with a CS ingredient or HU farmer label, we will use a hypothetical choice experiment survey method to estimate willingness to pay for these attributes. We have recently done a similar study to estimate willingness to pay for products made with local and organic ingredients [26]. In the survey, consumers will be presented with hypothetical products that vary in whether they are made with CS ingredients, whether the product has other CS attributes (other ingredients, packaging, etc.), whether the major ingredient is grown by HU farmers, and prices. Using statistical analyses of choices made by consumers over hypothetical products in the online survey, we will identify the consumer market share that is willing to pay for CS food and/or food made with ingredients grown by HU farmers, the characteristics of this consumer segment, and their willingness to pay for these attributes separately and jointly.

Overview of Reporting Requirements

Grant recipients are required to submit reports to document their performance under the Partnerships for Climate-Smart Commodity funding opportunity. These submissions will be required to use the Microsoft Excel workbook templates provided by USDA. The workbooks contain a series of worksheets that collect data in a standardized format to ensure data quality and allow for aggregation and summary of this information. The entire workbook must be submitted quarterly, with updates to all applicable worksheets. This guide is divided into three sections. The Overview of Reporting Requirements section summarizes the layout of the reporting workbook and presents the data elements included in each worksheet. It also describes additional documents that must be submitted to supplement the performance reports. The Data Definitions section provides descriptions and allowable response options for each data element. The guide also indicates whether each data element is required, applicable at times, or optional; as well as how frequently each data element must be updated. Finally, the Appendices contain practice and commodity lists that will be used for these reports. Reporting is necessary for USDA oversight of this effort. The data elements required for inclusion in the quarterly performance reports allow USDA to conduct selected audits to review whether producers are receiving federal funds from multiple sources for the same purpose; to determine whether GHG benefits from implementation of climate-smart agriculture and forestry (CSAF) practices are being estimated accurately; and for other purposes deemed appropriate by USDA.

The reporting worksheets collect information at four levels: project, partner, producer, and field. Descriptions of each level:

Project level: Information about activities and impacts at a whole project/aggregate level (i.e., reflecting all activities under the grant agreement). Some project-level reporting is further subdivided by commodity type or a combination of commodity and CSAF practice(s) (commodity x practice). **Partner level:** Information about activities related to a single organization (recipient, subrecipient, contractor, or other partner) within a project.

Producer level: Information about individual producers who have one or more farms enrolled in a project. **Field level**: Information about individual fields enrolled in a project.

Certain data elements are required to be reported for each producer and field enrolled in a project. In order to minimize the burden associated with data collection and to enable USDA to match data to existing records, these producer- and field-specific records must use the producer's established FSA Farm, Tract and Field IDs, and report the State and County associated with the Farm ID. Associated data entered in conjunction with these data elements, such as Producer Name, must match the data contained in the customer's Business Partner record, and the Farm Operating Plan in Business File for that Farm ID. Disclosure of this information is protected under Section 1619 of the Food, Conservation, and Energy Act of 2008 (PL 110- 246), 7 U.S.C. 8791. Additionally, Departmental Regulation 4370-001 provides USDA's policies for collecting demographic data, including race, ethnicity and gender. Providing demographic information is voluntary and at the discretion of the customer. Demographic information is used by USDA for statistical purposes only and will not be used to determine an applicant's eligibility for programs or services for which they apply.

Note: For purposes of this guide, "farm" refers to the operation from which climate-smart commodities are produced and may represent farms, ranches, forests or other operations. Similarly, "field" refers to the individual land units at which climate-smart practices are being implemented to produce climate-smart commodities and may represent lots, farmsteads or other units, depending on the type of operation and commodity. The use of "Farm", "Tract" and "Field" align with the FSA definitions; for example, "A field is a part of a farm that is separated from the balance of the farm by a permanent boundary, such as; fences, permanent waterways, woodlands, croplines in cases where farming practices make it probable that this cropline is not subject to change, and other similar features."

The following tables list the data elements included in each reporting worksheet, along with a brief description of each item.

Project Summary

These data will be collected about each project. Cumulative results are reported each quarter. Report last quarter's entry if there has been no change in this quarter.

Data element name	Description	Frequency
Commodity type	Type of commodity(ies) incentivized by the project	Quarterly
Commodity sales	Indicates sales of the commodity(ies) related to the project occurred this quarter	Quarterly
Farms enrolled	Indicates enrollment activities occurred this quarter	Quarterly
GHG calculation methods	Methods used to calculate greenhouse gas (GHG) benefits	Quarterly
GHG cumulative calculation	Method used to calculate cumulative GHG benefits	Quarterly
Cumulative GHG benefits	Whole project estimate of total GHG (CO2e) emission reductions	Quarterly
Cumulative carbon stock	Whole project estimate of total carbon sequestration	Quarterly
Cumulative CO2 benefit	Whole project estimate of total CO2 emission reductions	Quarterly
Cumulative CH4 benefit	Whole project estimate of total CH4 emission reductions	Quarterly
Cumulative N2O benefit	Whole project estimate of total N2O emission reductions	Quarterly
Offsets produced	Amount of carbon offsets produced by project	Quarterly
Offsets sale	Name of marketplace where carbon offsets were sold	Quarterly
Offsets price	Price of carbon in offset sales	Quarterly
Insets produced	Amount of carbon insets produced by project	Quarterly
Cost of on-farm TA	Cost of on-farm technical assistance (TA) provided to producers	Quarterly
MMRV cost	Cost of measurement, monitoring, reporting, and verification (MMRV) activities	Quarterly
GHG monitoring method	Methods used by project to monitor GHG benefits (up to 5)	Quarterly
GHG reporting method	Methods used by project to report on GHG benefits (up to 5)	Quarterly
GHG verification method	Methods used to verify GHG benefits (up to 5)	Quarterly

Partner Activities

These data will be collected at the project level. Each row in this worksheet will represent one organization involved in the project, including the recipient and all contributing partners. A partner is any organization that is receiving project funds or providing matching contributions (funds or in-kind contributions) to the project. While the recipient must complete one row for their own organization, not all data elements apply to the recipient. These exceptions are noted in the detailed descriptions of the specific elements in the *Data Definitions* section of this guide. Data are reported cumulatively each quarter. Report last quarter's entry if there has been no change in this quarter.

Data element name	Description	Frequency
Partner ID	Unique ID for each partner	One-time
Partner name	Name of partner organization	One-time
Partner type	Type of organization	One-time
Partner POC	Partner point of contact name	As applicable
Partner POC email	Partner point of contact email	As applicable
Partnership start date	Start of partnership on project	One-time
Partnership end date	End of partnership on project	As applicable
New partnership	Indicator for partner organizations that have no prior work with the recipient	As applicable
Partner total requested	Total amount requested to date by partner from recipient	Quarterly
Total match contribution	Total amount of match contribution by partner to date	Quarterly
Total match incentives	Total amount of match contribution by partner for incentives	Quarterly
Match type	Top 3 types of match contribution by partner, other than incentives	Quarterly
Match amount	Value of match contributions by type	Quarterly
Training provided	Top 3 types of training provided to the partner through project	Quarterly
Activity by partner	Top 3 types of activities provided by this partner to producers or other partners	Quarterly
Activity cost	Approximate cost per activity type provided by partner to producers or other partners	Quarterly
Products supplied	Names of products supplied to producers as part of project activities or incentives	Quarterly
Product source	Supplier or source of products supplied to producers as part of project activities or incentives	Quarterly

Table 2. Partner Activities elements

Marketing Activities

These data will be collected at the project level. Each row in this worksheet will correspond to one commodity for which the project enrolls fields and one marketing channel used to sell that commodity by the project or producers enrolled in the project. Data are reported for the current quarter and are not cumulative. If no sales of the commodity were reported during a quarter, do not complete this worksheet for that quarter.

Table 3. Marketing Activities elements

Data element name	Description	Frequency
Commodity type	Type of commodity incentivized by the project	Quarterly
Marketing channel type	Type of marketing channels used	Quarterly
Number of buyers	Number of buyers per marketing channel	Quarterly
Names of buyers	Names of buyers in the marketing channel	Quarterly
Marketing channel geography	Geography of marketing channel	Quarterly
Value sold	Value of commodity sold by marketing channel	Quarterly
Volume sold	Volume of commodity sold by marketing channel	Quarterly
Price premium	Price premium of commodity by marketing channel	Quarterly
Price premium to producer	Percent of price premium that goes to the producer	Quarterly
Product differentiation method	Top 3 types of product differentiation methods used	Quarterly
Marketing method	Top 3 types of marketing methods used	Quarterly
Marketing channel identification method	Top 3 ways marketing channel was identified	Quarterly
Traceability method	Top 3 types of supply chain traceability methods used	Quarterly

Producer Enrollment

These data will be collected at the producer level about each farm enrolled in the project. In this worksheet, each row will correspond to one farm that has at least one field enrolled in the project. Data are reported when a producer first enrolls one or more fields in the project. If a producer is enrolled in the project for multiple years, review the farm characteristics each time a new contract is signed and provide any necessary updates. The quarterly submission should contain information about each farm initially enrolled in the project during that quarter and for updates to farms that have re-enrolled during that quarter, as applicable. If no farms are enrolled during that quarter, do not complete this worksheet for that quarter.

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
State or territory	State name (must match FSA farm enrollment data)	
County of residence	County name (must match FSA farm enrollment data)	
Producer data change	Indicator that producer data was updated at re-enrollment	As applicable
Producer start date	Contract start date	Enrollment
Producer name	Name of primary operator	Enrollment
Underserved status	Indicator the primary operator is considered underserved and/or a small producer	Enrollment
Total area	Total area of enrolled operation	Annual
Total crop area	Total crop area in enrolled operation enrolled	Annual
Total livestock area	Total livestock confinement, pasture and rangeland in enrolled operation	Annual
Total forest area	Total forest area in enrolled operation	Annual
Livestock type	Top 3 types of livestock on enrolled operation	Annual
Livestock head	Total livestock currently managed (by type)	Annual
Organic farm	Indicator that part of the farm is certified or transitioning organic	Annual
Organic fields	Indicator that any of the enrolled fields are certified or transitioning organic	Annual
Producer motivation	Motivation for participation	Annual
Producer outreach	Top 3 types of outreach provided to producer	Annual
CSAF experience	Indicator of prior implementation of CSAF practices at this farm	Annual
CSAF federal funds	Indicator of prior receipt of federal funds for CSAF practices	Annual
CSAF state or local funds	Indicator of prior receipt of state funds for CSAF practices	Annual
CSAF nonprofit funds	Indicator of prior receipt of nonprofit funds for CSAF practices	Annual
CSAF market incentives	Indicator of prior receipt of market incentives for CSAF practices	Annual

Table 4. Producer Enrollment elements

Field Enrollment

These data will be collected about each field enrolled in the project. In this worksheet, each row corresponds to one field x commodity combination enrolled in the project. Generally, data are reported once for each field, at its initial enrollment. The quarterly submission should contain information about each field initially enrolled in the project during that quarter. If no fields are enrolled during that quarter, do not complete this worksheet for that quarter. If a field is enrolled for multiple years, any relevant changes, such as a new ID number or changes to the commodity or practice combinations should be entered in this worksheet during the quarter it is re-enrolled, or as applicable.

Data element name	Description
Farm ID	Unique Farm ID assigned by FSA
Tract ID	Unique Tract ID assigned by FSA
Field ID	Unique Field ID assigned by FSA
State or territory of field	State name
Physical County of field	Physical county name must match FSA farm records
Prior Field ID	Previous Field ID when reconstitution of farm results in new Field IDs
Field data change	Indicator that field data has changed from initial enrollment
Contract start date	Start date of contract
Total field area	Size of enrolled field
Commodity category	Category of commodity(ies) produced
Commodity type	Type of commodity(ies) produced
Baseline yield	Average yield of commodity in 3 years prior to enrollment
Baseline yield location	Location for which baseline yield is provided
Field land use	Most common land use in field in past 3 years
Field irrigated	Most common irrigation type in field in past 3 years
Field tillage	Most common tillage in field in past 3 years
Practice past extent - farm	Extent of operation that implemented this practice prior to project enrollment
Field any CSAF practice	Indicator for prior CSAF practices in this field in past 3 years
Practice past use - this field	Indicator of prior use of this practice in this field in the past 3 years
Practice type	CSAF practice(s) that will be implemented in enrolled field (up to 7)
Practice standard	Organization that developed CSAF practice standard implemented in field
Planned practice implementation year	Year that practice is planned to be implemented
Practice extent	Area or number of animals for which practice is implemented
Follow-on questions	Follow-on questions by practice type (see Table 11)

Farm Summary

These data will be collected about each farm enrolled in the project. In this worksheet, each row will correspond to one farm that has at least one field enrolled in the project. The quarterly submission should contain updates to any data elements that have changed for each farm enrolled in the project during that quarter. If there are no changes from the previous quarter, do not complete this worksheet for that quarter. Data are not cumulative.

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
State or territory	State name	
County of residence	County name	
Producer TA received	Type of technical assistance provided to producer	Quarterly
Producer incentive amount	Total financial incentive provided to the producer	Quarterly
Incentive reason	Top 4 reason(s) for financial incentives provided to producer	Quarterly
Incentive structure	Top 4 units on which financial incentives are structured	Quarterly
Incentive type	Top 4 type(s) of financial incentives provided to producer	Quarterly
Payment on enrollment	Extent of payment provided to producer upon enrollment	Quarterly
Payment on implementation	Extent of payment provided to producer upon implementation of CSAF practices	Quarterly
Payment on harvest	Extent of payment provided to producer upon harvest or slaughter	Quarterly
Payment on MMRV	Extent of payment provided to producer upon reporting or verification	Quarterly
Payment on sale	Extent of payment provided to producer upon sale of commodity	Quarterly

Table 6. Farm Summary elements

Field Summary

These data will be collected about each field enrolled in the project for a commodity x practice(s) combination. In this worksheet, each row will correspond to one field x commodity x practice(s) combination enrolled in the project. Data for each field will be reported quarterly and are not cumulative. Report data for any elements that have an update in that quarter. Greenhouse gas benefit estimates must be entered upon practice completion or annually, as appropriate. If there are no changes from the previous quarter, do not complete this worksheet for that quarter. This worksheet includes a section to report the "official" estimate of GHG benefits – amounts of greenhouse gas emissions reduced and carbon sequestered – for the field. These quantities refer to the estimates that are used to calculate the project's aggregate impact (reported in Table 1). Tables 8 and 9 are used to report alternate estimates of the field-level GHG benefits when additional methods are used to model (Table 8) or measure (Table 9) these impacts. Any field that can use COMET-Planner must submit those results, either as the official or alternate model.

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
Tract ID	Unique Tract ID assigned by FSA	
Field ID	Unique Field ID assigned by FSA	
State or territory of field	State name	
County of field	County name	
Commodity type	Type of commodity produced from field	Quarterly
Practice type	Type of practice(s) incentivized in field (up to seven)	Quarterly
Date practice complete	Date that practice implementation is certified complete	Quarterly
Contract end date	End date of contract	Quarterly
MMRV assistance provided	Indicator that MMRV assistance is provided to field	Quarterly
Marketing assistance provided	Indicator that marketing assistance provided for commodity from field	Quarterly
Incentive per acre or head	Indicator that a per acre/head incentives is provided for the CSAF practice(s) on this field	Quarterly
Field commodity value	Value of commodity produced from field	Quarterly
Field commodity volume	Volume of commodity produced from field	Quarterly
Cost of implementation	Total cost of practice implementation in field	Quarterly
Cost coverage	Percent of total cost of implementation of practice covered by project incentives	Quarterly
Field GHG monitoring	Methods used to monitor GHG benefits in field (up to 3)	Quarterly
Field GHG reporting	Methods used to report on GHG benefits for field (up to 3)	Quarterly
Field GHG verification	Methods used to verify GHG benefits for field (up to 3)	Quarterly
Field GHG calculations	Methods used to calculate GHG benefits for field	Quarterly
Field official GHG calculation	Method used to calculate official GHG benefits for field	Quarterly
Field official GHG ER	Official estimate of total GHG emission reductions for field	Quarterly
Field official carbon stock	Official estimate of total carbon sequestration for field	Quarterly
Field official CO2 ER	Official estimate of total CO2 emission reductions for field	Quarterly
Field official CH4 ER	Official estimate of total CH4 emission reductions for field	Quarterly
Field official N2O ER	Official estimate of total N2O emission reductions for field	Quarterly
Field offsets produced	Amount of carbon offsets produced in field	Quarterly
Field insets produced	Amount of carbon insets produced in field	Quarterly
Other field measurements	Indicator that field data was collected for reasons other than GHG benefit estimation	Quarterly

Table 7. Field Summary elements

GHG Benefits - Alternate Modeled

If greenhouse gas benefits are modeled for the same field using multiple methods, the results for the alternate models are reported in this worksheet. The "alternate" models refer to those model results that were not used in the calculation of the project's aggregate impact (as reported in Table 1). Any field that can use COMET-Planner must submit those results, either as the official or alternate model. These data will be collected about the modeled GHG benefits for each field x commodity x practice(s) combination. In this worksheet, each row will correspond to one field enrolled in the project. Data are not cumulative. Each quarterly submission should include information for all fields that have new modeled data. Greenhouse gas benefit estimates must be entered upon practice completion or annually, as appropriate.

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
Tract ID	Unique Tract ID assigned by FSA	
Field ID	Unique Field ID assigned by FSA	
State or territory of field	State name	
County of field	County name	
Commodity type	Type of commodity(ies) produced from the field (up to 6)	Annual
Practice type	Type of practice(s) incentivized in field (up to 7)	Annual
GHG model	Model used to calculate GHG benefits	Annual
Model start date	Start date of model run	Annual
Model end date	End date of model run	Annual
Total GHG benefits estimated	Estimate of total GHG benefits for field	Annual
Total carbon stock estimated	Estimate of total change in carbon stock for field	Annual
Total CO2 estimated	Estimate of total CO2 emission reductions for field	Annual
Total CH4 estimated	Estimate of total CH4 emission reductions for field	Annual
Total N2O estimated	Estimate of total N2O emission reductions for field	Annual

Table 8. GHG Benefits - Alternate Modeled elements

GHG Benefits - Measured

Projects must report the results of any carbon stock or greenhouse gas emission measurements in this worksheet. These data will be collected at the field level. Each row will represent a separate measurement method used to calculate GHG benefits for a given field. Data are reported once per year of measurement and are not cumulative. Each quarterly submission should include information for any field for which there are new soil samples or new calculations of annual GHG benefits based on actual measurements.

Data element name Description Frequency Farm ID Unique Farm ID assigned by FSA Tract ID Unique Tract ID assigned by FSA Field ID Unique Field ID assigned by FSA State name State County County name GHG measurement method Method of measurement Annual Lab name Entity that conducted analysis Annual Measurement start date Start date of measurements Annual Measurement end date End date of measurements Annual Total CO2 reduction calculated Calculation of total CO2 reduction Annual Total carbon stock change calculated Calculation of change in carbon stock Annual Total CH4 reduction calculated Calculation of total CH4 reduction Annual Total N2O reduction calculated Calculation of total N2O reduction Annual Numeric result from soil sample Soil sample result Annual Type of analysis conducted Measurement type Annual

Table 9. GHG Benefits - Measured data elements

Additional Environmental Benefits

Projects that track additional environmental benefits (e.g., water quality improvements) from enrolled fields report results in this worksheet. These data will be collected about each field. Each row in this worksheet will correspond to an enrolled field. Data are not cumulative. Estimates of environmental benefits must be entered upon practice completion or annually, as appropriate.

Table 10. Additional Environmental Benefits elements

Data element name	Description	Frequency
Farm ID	Unique Farm ID assigned by FSA	
Tract ID	Unique Tract ID assigned by FSA	
Field ID	Unique Field ID assigned by FSA	
State	State name	
County	County name	
Environmental benefits	Indicator that project tracks other environmental benefits	Annual
Reduction in nitrogen loss	Indicator that project tracks reductions in nitrogen loss	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Reduction in phosphorus loss	Indicator that project tracks reductions in phosphorus loss	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Other water quality	Indicator that project tracks other water quality improvements	Annual
Туре	Type of water quality metric being tracked	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Water quantity	Indicator that project tracks reduced water use	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Reduced erosion	Indicator that project tracks reductions in soil erosion	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Reduced energy use	Indicator that project tracks reductions in energy use	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Avoided land conversion	Indicator that project tracks reductions in land conversion	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual
Improved wildlife habitat	Indicator that project tracks improvements in wildlife habitat	Annual
Amount	Amount	Annual
Purpose	Purpose of tracking those co-benefits	Annual

Supplemental Data Submission

Project MMRV Plan

Definition of MMRV elements:

Measurement: Quantification of the greenhouse gas benefits (reduction or capture) using mathematical models and/or direct physical measurements in the field

Monitoring: Ongoing review and confirmation that the climate-smart practice has been implemented according to the agreed upon standard and documentation of any changes in the site, implementation, or GHG emissions impacts over time

Reporting: Documenting and sharing monitoring and measurement results with project partners, the recipient, and any third-party verification organization

Verification: Independent confirmation that measurement, monitoring and reporting information are complete, accurate and reliable.

Projects must submit an MMRV plan that includes details about how each of the following are addressed:

- Quantification approach, including:
 - GHG models used
 - GHG measurement plan (if applicable)
 - Approach to quantifying additional environmental benefits, if applicable (e.g., water quality, habitat)
- Verification approach:
 - o Compliance criteria
 - Verification plan/methodology
- Approach to ensuring:
 - o Additionality
 - o Permanence
 - o Leakage
 - Impacts of weather
- Plan for non-compliance

If the project is using a specific MMRV methodology or approach developed by the recipient, a project partner, or an outside organization, the project can submit documentation associated with the methodology as long as the documentation addresses each of the above categories.

If the project is tracking other environmental benefits (as reported in the *Additional Environmental Benefits* worksheet), include a description of the methodology and tools used to track and report on these benefits.

Field modeled GHG benefit reports

Results from any models besides COMET-Planner used to estimate GHG benefits must also be submitted as a separate report. This includes projects running COMET-Farm. The full results of any model can be submitted in the native/standard format generated by the modeling tool and must include the following Unique IDs in the report or in the file name: State, County, Farm ID, Tract ID, Field ID.

Field direct measurement results

For any direct physical measurements in the field, measurement results must be submitted as a separate report and must include the following Unique IDs in the report or in the file name: State, County, Farm ID, Tract ID, Field ID. Measurement results reports must include the name of the equipment used for sampling or data collection, the name of the lab that analyzed the data, and the analytical method used.

Sample report types include soil analysis reports, summarized results of portable emissions analyzers or flux towers, water quality analyses, and plant species counts. These could be collected for the purposes of determining GHG emission reductions or carbon sequestration amounts, for calibration of tools or models, for tracking other environmental benefits, or for other reasons.

Data Descriptions

This section provides descriptions and allowable response options for each data element. The guide also indicates whether each data element is required, applicable at times, or optional; as well as how frequently each data element must be updated.

Unique IDs

Project ID: Unique ID at the project level – "Award Identifying Number" shown on award documentation
Partner ID: Unique ID at the partner level – use EIN; if no EIN, a unique ID will be assigned for use in these reports
State or territory of operation: State or territory name
County of operation: Physical county name
Farm ID: Unique ID at the operation level assigned by Farm Service Agency (FSA)

Tract ID: Unique ID at the tract level assigned by FSA

Field ID: Unique ID at the field level assigned by FSA

Project Summary

Commodity type		
Data element name: Commodity type	Reporting question: What climate-smart commodity types are produced by this project?	
Description: Type of commodity incentivia	zed by the project. These commodities include those for whom	
farmers are directly receiving incentives o	r other types of marketing support. See full list of commodity options	
in Appendix B. List one commodity per rov	Ν.	
Data type: List	Select multiple values: No	
Measurement unit: Category	Allowed values: FSA commodity list

Model start date	
Data element name: Model start date	Reporting question: For what time period are the GHG benefits modeled (model start date)?
Description: Date that the model parameters	s begin.
Data type: Date	Select multiple values: NA
Measurement unit: MM/DD/YYYY	Allowed values: 01/01/1950 - 12/31/2030
Logic: None – all respond	Required: If project calculates GHG benefits using multiple methods
Madal and data	Data collection frequency: Annual
Nodel end date	Departing question: For what time pariod are the
Data element name: Model end date	GHG benefits modeled (model end date)?
Description: Date that the model parameters	s end.
Data type: Date	Select multiple values: NA
Measurement unit: MM/DD/YYYY	Allowed values: 01/01/2023-12/31/2030
Logic: None – all respond	Required: If project calculates GHG benefits using multiple methods
Data collection level: Field	Data collection frequency: Annual
Total GHG benefits estimated	
Data element name: Total GHG benefits	Reporting question: What is the alternate estimate of the field's
estimated	total GHG emission reductions?
Description: Total greenhouse gas emission i	reductions from practice implementation in the field estimated
Data type: Decimal	Select multiple values: No
Measurement unit: Metric tons COreg	Allowed values: 0-10 000 000
Logic: None – all respond	Required: If project calculates GHG benefits using multiple
Data collection level: Field	methods Data collection frequency: Annual
Total carbon stock estimated	
Data element name: Total carbon stock	Reporting question: What is the alternate estimate of how much
Description: Total change in carbon stock ha	sed on practice implementation in the field estimated using an
alternate model. Conversion rate is one ton	of carbon = 3.67 tons of CO ₂ eq.
Data type: Decimal	Select multiple values: No
Measurement unit: Metric tons CO2eq	Allowed values: 0-10,000,000
Logic: None – all respond	Required: If project calculates GHG benefits using multiple methods
Data collection level: Field	Data collection frequency: Annual
Total CO2 estimated	
Data element name: Total CO2 estimated	Reporting question: What is the alternate estimate of the field's
Description: Total carbon dioxide emission re	eductions based on practice implementation in the field estimated
Data type: Decimal	Select multiple values: No
Measurement unit: Metric tons CO	Allowed values: 0-10,000,000
Logic: None – all respond	Required: If project calculates GHG benefits using multiple
Data collection level: Field	Data collection frequency: Annual

USDA	Partnerships for Climate-Smart Commodities Data Dictionary for Recipients

GHG measurement method

Data element name: GHG measurement methods	nod Reporting question: What measurement method is used to calculate GHG benefits?
Description: Field-based measurement metho	d used to calculate GHG benefits. If "other" is chosen, enter the
appropriate value as free text in the additiona	l column.
Data type: List	Select multiple values: No
Measurement unit: Category	Allowed values:
	 Emissions measurement unit
	Flux towers
	Litterbags
	 Plant measurements
	Portable emissions
	analyzers
	 Soil flux chambers
	 Soil samples
	 Soil sensors
	 Vehicle-mounted sensors
	 Other (specify)
Logic: None – all respond	Required: If a project conducts soil samples or takes carbon stock or greenhouse gas emission measurements in this field
Data collection level: Field	Data collection frequency:
	Annual
Lab name	
Data element name: Lab name	Reporting question: What is the name of the lab that processed the measurement samples?
Description: Name of entity that received data	a and conducted analysis of samples.
Data type: Text	Select multiple values: No
Measurement unit: NA	Allowed values: Free text

Logic: None – all respond	Required: If applica	ble
	tradient and the blue	-

Data collection level: Field Data collection frequency: Annual

Measurement start date	
Data element name: Measurement start date	Reporting question: On what date did the measurement start?
Description: Date that the measurements began. If it was and end date. If multiple measurements took place over	as a single point in time, use the same date for start date a time period, use the date that the measurements first
Degan. Data type: Date	Select multiple values: No
Measurement unit: MM/DD/YYYY	Allowed values: 01/01/2023 - 12/31/2030
Logic: None – all respond	Required: If a project conducts soil samples or takes carbon stock or greenhouse gas emission measurements in this field
Data collection level: Field	Data collection frequency: Annual
Measurement end date	
Data element name: Measurement end date	Reporting question: On what date did the measurement end?
Description: Date that the measurements began. If it was and end date. If multiple measurements took place over were completed.	as a single point in time, use the same date for start date a time period, use the date that the measurements
Data type: Date	Select multiple values: No
Measurement unit: MM/DD/YYYY	Allowed values: 01/01/2023- 12/31/2030
Logic: None – all respond	Required: If a project conducts soil samples or takes carbon stock or greenhouse gas emission measurements in this field
Data collection level: Field	Data collection frequency: Annual
Total CO2 reduction calculated	0
Data element name: Total CO2 reduction calculated Description: Total annual CO2 emission reductions base from in-field measurements.	Reporting question: What are the total measured CO2 emission reductions? d on practice implementation in the field calculated
Data type: Decimal	Select multiple values: No
Measurement unit: Metric tons CO ₂	Allowed values: 0-10,000,000
Logic: None – all respond Data collection level: Field	Required: If a project takes carbon stock or greenhouse gas emission measurements in this field Data collection frequency:
	Annual
Total field carbon stock measured	Penerting question: What is the total amount of
measured	carbon sequestered based on repeat measurements in this field?
Description: Change in carbon stock based on practice is sampling in this field. (Results for initial field soil sample 'Measurement type" columns.) Conversion rate is one to Data type: Decimal	mplementation in the field calculated from repeat soil s should be reported in the 'Soil sample result' and on of carbon = 3.67 tons of CO ₂ eq. Select multiple values: No
Measurement unit: Metric tons CO2eq	Allowed values: 0-10,000,000
Logic: None – all respond	Required: If a project conducts soil samples or takes carbon stock measurements in this field
Data collection level: Field	Data collection frequency: Annual

Total CH4 reduction calculated	
Data element name: Total CH4 reduction calculated	Reporting question: What are the total measured CH4 emission reductions?
Description: Total annual methane emission reductions b	ased on practice implementation in the field calculated
from in-field measurements. Conversion rate is one ton o	f $CH_4 = 25$ tons of CO_2 eq.
Data type: Decimal	Select multiple values: No
Measurement unit: Metric tons CH4 reduced in CO2eq	Allowed values: 0-10,000,000
Logic: None – all respond	Required: If a project conducts soil samples or takes carbon stock or greenhouse gas emission measurements in this field
Data collection level: Field	Data collection frequency: Annual
Total N20 reduction calculated	
Data element name: Total N2O reduction calculated	Reporting question: What are the total measured N2O emission reductions?
Description: Total annual nitrous oxide emission reductio	ns based on practice implementation in the field
calculated from in-field measurements. Conversion rate is	s one ton of $N_2O = 298$ tons of CO_2eq .
Data type: Decimal	Select multiple values: No
Measurement unit: Metric tons N2O reduced in CO2eq	Allowed values: 0-10,000,000
Logic: None – all respond	Required: If a project conducts soil samples or takes carbon stock or greenhouse gas emission measurements in this field
Data collection level: Field	Data collection frequency: Annual
Soil sample result	
Data element name: Soil sample result	Reporting question: What is the numeric result from this soil sample?
Description: Results of measurement(s) taken to determi	ne the carbon stock of a soil (the tons of carbon found
in a specified volume of soil).	
Data type: Decimal	Select multiple values: No
Measurement unit: Amount	Allowed values: .00001-100,000
Logic: None – all respond	Required: If a project conducts soil samples in this field
Data collection level: Field	Data collection frequency: Annual
Soil sample result unit	
---	---
Data element name: Soil sample result unit	Reporting question: What is unit for the soil sample result?
Description: Unit for the corresponding soil s for this data element. If "other" is chosen, us	ample result. The worksheet provides a drop-down list of choices e the additional column to enter the appropriate yield unit as free
Data type: List	Select multiple values: No
Measurement unit: Category	Allowed values: Percent
	 Ppm Grams
	 Grams per cubic centimeter Other (specify)
Logic: None – all respond	Required: If a project conducts soil samples in this field
Data collection level: Field	Data collection frequency: Annual
Measurement type	
Data element name: Measurement type	Reporting question: What type of analysis was conducted for this soil sample?
Description: Type of soil analysis conducted. element. If "other" is chosen, use the addition	The worksheet provides a drop-down list of choices for this data nal column to enter the appropriate yield unit as free text.
Measurement unit: Category	Allowed values: • Organic matter • Total organic carbon • Bulk density • Other (specify)
Logic: None – all respond	Required: If a project conducts soil samples in this field

CSAF Practice Sub-questions

For some CSAF practices, there is an additional set of questions that are unique to each practice. Responses to these questions are needed to verify estimated GHG benefits of these practices. If a field is implementing a CSAF practice with an NRCS CPS code in Table 11, answer the follow-up questions listed next to the relevant practice name in the table. Use the *Supplemental Reporting Workbook – CSAF Practice Sub-questions* to report the required information.

Table 11. Follow-on questions for select CSAF practices

Practice name and code	Follow-up question	Options (select one)
Alley Cropping (CPS 311)	Species category (select most common/extensive type if using more than one)	Coniferous trees Deciduous trees Shrubs
	Species density (number of trees planted per acre)	1-10,000
Anaerobic Digester (CPS 366)	Waste storage system prior to installing anaerobic digester	Aerobic lagoon Anaerobic digester (complex mix) with energy generation Anaerobic digester (plug flow) with energy generation Anaerobic lagoon Composting Covered lagoon (no energy generation or flaring) Covered lagoon with energy generation Covered lagoon with energy generation Covered lagoon with flaring Daily spread Deep bedding pack Deep pit Dry lot Dry stacking/solid storage Pasture/range/paddock Poultry with bedding Poultry without bedding (e.g., high rise) Slurry tank/basin
	Digester type	Covered lagoon with energy generation Covered lagoon with flaring Covered lagoon (no energy generation or flaring) Complex mix with energy generation Plug flow with energy generation Other (specify)
	Additional feedstock source (select most common if using more than one)	Food waste Straw or bedding Wastewater Other (specify)

		Coal

Partnerships for Climate-Smart Commodities Additional Specific Terms and Conditions February 2023

I. Overarching Statement

The following award terms and conditions are applicable to Partnerships for Climate-Smart Commodities agreements and are in addition to the USDA FPAC General Terms and Conditions. The award recipient must abide by all terms of this grant including, but not limited to, the General Terms and Conditions, the terms in the Funding Opportunity and associated Frequently Asked Questions, and this addendum. The recipient must also deliver on the planned objectives in the project narrative and budget narrative associated with this grant.

II. Eligibility and Highly Erodible Lands and Wetlands Compliance

In order to be eligible for an incentive payment as a part of the Partnerships for Climate-Smart Commodities, a producer must:

- Establish Farm Records with the Farm Service Agency (FSA) (have farm, tract, and field numbers in place);
- Complete an AD-2047 (Customer Data Worksheet to facilitate the collection of customer data for Business Partner Record);
- Certify highly erodible land conservation (HEL) and wetland conservation (WC) compliance via Form AD-1026, Highly Erodible Land Conservation (HELC) and Wetland Conservation (WC) Certification; and
- Certify that they are not a foreign person or entity.

Farm, tract, and field numbers are required for the producer, and ultimately the Partnerships for Climate-Smart Commodities recipient, to report climate-smart practice implementation to USDA, as well as to certify and maintain HELC/WC compliance. This will require that some producers who do not already have these numbers, like perennial crop growers or feedlots, establish these records with USDA's FSA. Farm, tract, field numbers, producer name, and Core Customer I.D. (CCID) will be provided by the recipient to the National Program Officer as a part of routine grant reporting. Recipients must ensure that producers receiving financial assistance or incentives through this project use the same name as is included in the relevant FSA Business File for that Farm ID in any contracts or similar documentation kept by the recipient.

Producers are not bound by the payment limitations and the adjusted gross income (AGI) limitations that are in place for other USDA programs.

In order to demonstrate HELC/WC compliance for Partnerships for Climate-Smart Commodities incentive payments, producers will need to request a copy of their subsidiary print from their

Partnerships for Climate-Smart Commodities Additional Specific Terms and Conditions Page 1 of 6 February 2023 USDA FSA field office. The Subsidiary Print includes print year specific eligibility related information about a selected producer. The producer will then provide this documentation to the Partnerships for Climate-Smart Commodities recipients as proof of compliance. A current year subsidiary print will be required for each crop year that the producer receives a payment, and HELC/WC eligibility information is provided under the AD-1026 and Conservation Compliance sections of subsidiary (determined by year, which can change at any time during the year or in a subsequent year). As is the case already, field offices will not be expected to provide documentation to anyone besides the producer themselves (and must always comply with Section 1619 limitations if they ever do provide documentation to third parties). Producers must have control of the land for the term of their beneficiary contract.

Recipients are responsible for determining producer eligibility within the funding opportunity requirements. Recipients must inform producers of eligibility requirements and direct them to local USDA offices for requested information as necessary, including but not limited to, farm and tract establishment and Highly Erodible Land and Wetland Compliance determinations. Privacy of producers is a priority throughout this process, and recipients are responsible for maintaining producer privacy in the process.

At minimum, the recipient will collect and review subsidiary reports from participating producers. They will ensure that the producer is listed as "compliant" in all sections of the conservation compliance portion of subsidiary and "certified" for AD-1026 before an incentive payment is made. If payments to a producer span more than one Federal fiscal year, the recipient will review an updated subsidiary print each fiscal year to ensure that the status is still compliant.

III. Other Environmental and Cultural Resources Reviews

A Finding of No Significant Impact (FONSI) was signed by USDA NRCS on August 26, 2022. A copy of the Programmatic Environmental Assessment for Partnerships for Climate-Smart Commodities is available at <u>www.usda.gov/climate-smart-commodities</u>. USDA may determine that additional environmental and cultural resources review is needed for any particular action under Partnerships for Climate-Smart Commodities. The recipient must not execute any beneficiary contracts under this grant agreement prior to receipt of a letter from USDA that specifically details:

- 1) further procedures deemed appropriate by the Agency to ensure a completed National Environmental Policy Act (NEPA) review and all appropriate consultation requirements are met, and
- 2) additional instructions for any unanticipated discoveries or conditions.

A resolution of support is required for projects on Tribal lands from the governing body of the Tribe with jurisdiction over that land, if the applicant is not the Tribe nor an entity owned or operated by that Tribe. USDA may approve alternative documentation for resolutions when USDA deems necessary and legally sufficient.

IV. Producer Benefits

USDA encourages the recipient to disclose to participating producers the manner and amount for which any market premiums derived from the development of the relevant climate-smart commodity will be shared between participating parties, including producers. USDA will be monitoring producer benefits, in particular those to small and underserved producers, throughout the grant period. Recipients agree that their project(s) will implement a plan for engaging small and underserved producers as laid out in this agreement.

V. Producer Data Protection and Disclosure

Recipients must ensure each producer has convenient access to any data collected from that producer or the producer's land and any associated modeling as part of the project. The recipient must provide each producer applying for benefits under this grant a description in writing of how their information, including but not limited to data about their farm and commodities, will be utilized, protected and shared as applicable.

VI. Other Data and Reporting Requirements

In addition to the reporting information provided in the statement of work and General Terms and Conditions, USDA will provide a template for the Detailed Progress Report, also known as the Partnerships for Climate-Smart Commodities (PSCS) Project Reporting Workbook. Within 30 calendar days of execution of this grant, a copy of this workbook will be posted at <u>www.usda.gov/climate-smart-commodities</u> or an alternative location provided to the recipient by the National Program Officer. USDA may provide updates to the PCSC Project Reporting Workbook or submission methods to streamline the data collection process and/or reduce the burden on the recipient throughout the grant period. Generally, these updates will be provided at least 3 months in advance of any required changes. The recipient must not transfer any data to foreign governments or foreign entities without prior approval from USDA.

USDA will provide a Technical Contact for this grant. The Technical Contact will have the responsibility of technical oversight for USDA for the project. The recipient is responsible for providing the technical assistance required to successfully implement and complete the project. The recipient must comply with any requests for information from the Technical Contact. The Technical Contact for this award is the National Program Officer assigned to this grant.

Prior to execution of this grant, the recipient must provide a shapefile depicting the project boundary for enrollment under this grant. Producer enrollment may not occur outside this boundary without modification of this grant. Within 30 calendar days of execution of this grant, the recipient must provide to the National Program Officer a website address where enrollment information will be posted for producers for the project associated with this grant. Recipients will be responsible for the following reports:

- Submit quarterly performance reports that include a written progress report, as well as additional reporting on specific data elements contained in the most up-to-date version of the Partnerships for Climate-Smart Commodities Project Reporting Workbook. Additional information about each reported element is described in the Data Dictionary.
- Submit supplemental reports required to validate greenhouse gas (GHG) benefit data, including: (1) an initial project MMRV plan, (2) field-modeled GHG benefit reports, and (3) field-direct GHG measurement results, as applicable. Additional information about these reports is in included in the Data Dictionary.
- Submit copies of project outputs and deliverables (e.g., fact sheets, reports) as attachments in ezFedGrants along with quarterly performance reports.
- Report the version of COMET-Planner used to estimate GHG benefits of the project within each quarterly performance report. As COMET-Planner is updated, recipients must adopt the latest version of the tool as directed by USDA for use in performance reports.

Recipients must designate an individual as a member of the USDA Partnerships for Climate-Smart Commodities Learning Network (Partnerships Network); this representative should be identified in the Project Narrative for this grant. Each project includes a plan for up to two Partnerships Network virtual meetings and two in-person meetings a year during the project duration. Dates and other details on events will be posted at <u>www.usda.gov/climate-smartcommodities</u> or an alternative location provided to the recipient by the National Program Officer.

The Partnerships Network will be co-chaired by representative from the USDA Office of the Chief Economist and the Farm Production and Conservation Mission Area. The Partnerships Network will inform synthesis reports to be assembled by USDA on a range of topics related to the implementation of Partnerships for Climate-Smart Commodities projects, including:

- Lessons-learned as projects are implemented;
- Options for providing technical assistance;
- Procedures for measurement/quantification, monitoring, reporting, and verifying GHG benefits;
- Options for tracing climate-smart commodities through the supply chain;
- Mechanisms for reducing costs of implementation;
- A forum for discussion and learning regarding approaches to climate-smart agriculture and forestry implementation (including but not limited to deployment and

measurement/quantification, monitoring, reporting, tracking, and verification of associated greenhouse gas benefits and marketing of climate-smart commodities).

- Synthesis of outcomes; and
- Opportunities for USDA and others to inform future approaches to generating new and expanded markets for climate-smart commodities.

The Partnerships Network topics to be discussed will cover at minimum the areas described in previous FAQs and will evolve with USDA's ongoing project data analysis efforts and with input from the project recipients on the kinds of sessions that will be most helpful to them in building the diverse climate-smart markets associated with their projects. Participation may include at least one interview a year and include questions related to the following areas:

- Technical assistance approaches, methods, and successes and/or challenges
- Producer outreach approaches, methods, and successes and/or challenges
- Monitoring, measurement, reporting, and verification (MMRV) approaches, methods, and successes and/or challenges
- Marketing approaches, methods, and successes and/or challenges
- Partnership approaches, methods, and successes and/or challenges
- Data collection and storage approaches, methods, and successes and/or challenges
- Supply chain approaches, methods and successes and/or challenges, including approaches to traceability
- Supply chain benefits and demand for climate-smart commodities
- Perspectives on program design, climate-smart commodity definitions, and future approaches or opportunities
- Project successes and stories

USDA may also request producer exit reports at a later date. Additional marketing and branding-related requirements may be provided by USDA, including signage related to Partnerships for Climate-Smart Commodities.

VII. Competition and Anti-Competitive Practices

In connection with this grant, recipients may not prohibit or otherwise limit a producer from changing the provider of other services or materials not included as part of this grant. Recipients may not condition, limit, steer, or discriminate in their provision or sale of non-project business functions or products to producers based on their participation or non-participation in or use of any services provided as part of this grant. Additionally, funds in this agreement shall not be used for purposes or activities related to mergers or acquisitions.

VIII. Suspension and Disbarment

The provisions governing Suspension and Disbarment in subsection 1.a.8 shall also apply to fraud, embezzlement, theft, forgery, bribery, falsification, or destruction of records, making false statements, or violations of the Federal civil antitrust or unfair trade practice laws.

IX. Special provisions for awards to for-profit entities as recipients

This section contains provisions that apply to awards to for-profit entities. These provisions are in addition to other applicable provisions of these terms and conditions, or they make exceptions from other provisions of the terms and conditions for awards to for-profit entities. For-profit entities that receive awards have two options regarding audits:

- A financial related audit of a particular award in accordance with Generally Accepted Government Auditing Standards issued by the Comptroller General of the United States, in those cases where the for-profit entity receives awards under only one USDA program; or, if awards are received under multiple USDA programs, a financial related audit of all awards in accordance with Generally Accepted Government Auditing Standards issued by the Comptroller General of the United States; or
- 2) An audit that meets the requirements contained in 2 CFR 200 subpart F.

For-profit entities that receive annual awards totaling less than the audit requirement threshold in 2 CFR 200 subpart F are exempt from USDA audit requirements for that year, but records must be available for review by appropriate officials of Federal agencies or the Government Accountability Office.

X. Non-Disparagement

Recipients may not engage in any advertising deemed by USDA as disparaging to another agricultural commodity or competing product, or in violation of the prohibition against false and misleading advertising. Disparagement is defined as anything that depicts other commodities in a negative or unpleasant light via overt or subjective video, photography, or statements. Comparative advertising is allowable, provided the presentation of facts is truthful, objective, not misleading, and supported by a reasonable basis.
